## at Berlin and Frankfurt **L-M-BARTOW** high intensity runway lighting helps speed "Vittles"

The U. S. Air Force, with its long and favorable experience with "Bartows" in the Aleutians, Newfoundland, and other tough flying areas, has installed these high intensity lights on Berlin Air Lift terminals to assure maximum number of landings in this all-important "Vittles" operation. A Tempelhof passover means no landing; under the precisely scheduled operation there's no time for a second pass, and the ship returns to its base still loaded.

In addition to scores of air force and navy bases, many commercial airports and airlines enjoy the benefits of greatly reduced cancellations and passovers, and greatly increased safety provided by L-M-Bartow lighting.

Here are some of the commercial airports that have or are installing the latest type "Bartows" which have the controllable beam that makes possible the very high intensity of 180,000 beam candlepower—without glare!

## Airborne weight lifter with *Real Stamina*

A leading aircraft manufacturer sought a better cargo hoist unit to expedite the loading and unloading of planes to be used in a vital cargo carrying operation. Specifications called for explosion proofing, greater dependability and longer life than existing units.

Westinghouse was selected to do the job. The finished product, which meets these most exacting requirements, is illustrated above. Here are some of its advanced features.

1. Newly developed frame member that makes the assembly explosion-proof.
2. Twenty-four vph. specially-designed, dry water.
3. Speed limiter for close regulation of up and down speed.
4. Triple planetary gears for speed reduction.

In addition, the unit contains a torque-limiting clutch and a magnetic brake for holding the load in case of power failure. Also separate construction of brake and speed-limiting device permits accurate "braking" of the hoist for handling critical loads.

Weighing only 52 lbs., it is capable of lifting 4,500 lbs. at the rate of 24 feet per minute. Its unusually long life eliminates the necessity of carrying a spare so that both weight and space are saved.

A Westinghouse Engineer will be glad to give you further information or work with you on other aircraft problems.

## "Engine fire will start in 10 seconds"

Engine fires are no accidental occurrence at the Kidde proving grounds! They're planned in advance, started by the hand-dred, in a B-26 power plant—fueled instantly into a roaring blaze by the artificial shipstream set up by the propeller of a second engine.

That's how we go about studying the speed and efficiency of fire-extinguishing agents—under conditions that closely

approximate actual flight. CO<sub>2</sub>, MB, C.B., D.L., the Freons—we've timed the fire-killing speed of them all with split-second accuracy.

That's just a part of Kidde's research program—continuously carried on in the interests of safer flying. We're also ready to place the results of our research at the disposal of government agencies, aircraft manufacturers and transport companies.

The word "Kidde" and the Kidde and its trademarks of Walter Kidde & Company, Inc.

Walter Kidde & Company, Inc. • 410 Main Street, Belleville 9, N. J.

NATIONAL AIRLINES DC-4 SEVENTEEN "400" SEVENTEEN SPINDLER, well insulated, air conditioned and automatically pressurized cabin, is now added to National's fleet. National provides service on 24 cities in 12 Eastern and Southern states, the District of Columbia and Cuba. This progressive airline has used Texaco Aircraft Engine Oil exclusively for nearly 10 years.

# Greater Dependability and Economy

TEXACO aviation lubricants are top quality — designed for specific lubricating jobs. And Texaco's unsurpassed lubrication plan enables you — through the use of only *one* Texaco lubricant — to meet all engine and auxiliary lubrication requirements more effectively — to assure greater dependability in flight — greater operating economy.

Texaco Lubrication Engineering Service helps you in additional ways — with suggestions on maintenance shop layout, storage and handling of lubricants and fuels, lubrication techniques, and the safest, most efficient maintenance practices for your particular operation.

Let Texaco help you increase efficiency and reduce costs. Just call the nearest of the 2800 Texaco Wholesale Distributing Plants in the 48 States, or write: The Texaco Company, Aviation Division, 135 East 42nd Street, New York, 17, N. Y.

...the BIG reasons why airlines everywhere use Texaco Aviation Products and Lubrication Engineering Service.

More revenue airline sales in the U. S. are flown with Texaco Aircraft Engine Oil than with any other brand!

FOR THE AVIATION INDUSTRY

Texaco is... TEXACO STAR THEATRE every Wednesday night starring Milton Berle. See advertisement for time and station.

## THE AVIATION WEEK

### The Pentagon Picture

The first two weeks of Louis Johnson's tenure as Secretary of National Defense have shown a marked change in Pentagon atmosphere.

In place of rule by committees and boards that stifled the Forrestal administration is the influence of a strong personality with positive ideas on how to run what is probably the most administratively complex and most important job in the Texaco industry. It is already evident that Louis Johnson intends to run the National Military Establishment for as long as he holds his present job.

But even if the Johnson regime is not yet clear his ideas are already showing signs in the wind. Not the least revealing is the emergence of Gen. Joseph T. McNamara as one of Johnson's most powerful military advisers. McNamara, an Air Force veteran with a long reputation as an able military administrator, has been given the job of organizing the sprawling and cumbersome main service groups that have grown into a monstrous mass during the post-war years. None of these groups have already been abolished. McNamara may become the permanent chairman of the Joint Chiefs of Staff in a position in which he would wield enormous influence over the entire defense organization. This would give some interesting problems for the future. The world now seems interesting problems for the future. The world now seems interesting problems for the future. The world now seems interesting problems for the future.

### McNamara Position

McNamara belongs to an older military generation than the present post-war USAF leaders and has been in sharp disagreement with them often on more than one occasion. It will be interesting to see what the McNamara-Johnson organization does to the USAF and its top general. McNamara continues in his present capacity it is not an ally that Gen. George C. Kenney, brilliant air strategist, may return from his assignment at the Air University to one of the new top jobs in the expanding military picture.

Johnson has made no secret of his opinion that air power is the first line of American defense and sets top priority to the National Military Establishment. In this policy he will find himself more in tune with the public, press and Congress than was his predecessor. Johnson has been an active politician for a long time and is politically astute.

### Political Ambitions

He is already being mentioned as a possibility for the Democratic nomination for the presidency in 1952 if President Truman yields to his decision not to run again. Against this background Johnson will be striving to turn in an outstanding job in his present capacity, without showing any better intentions.

There will be a difficult task. For the two big jobs that must be done before the National Military Establishment can operate efficiently are to clean away administrative cobwebs that have been accumulating in all these services for generations and to launch rigorous the heads of a few of the most antiquated branches in the competition between the

Air Force and Naval Aviation. Doing both these jobs with dispatch will create better services as well as greater efficiency.

### Administration Maze

Extent to which administrative procedures have become most tangled instead of simplified since uniformity is threatened by what now happens to military aircraft groups and units. Formerly they were cleared by the Navy and the War Department. Now they go from USAF and Navy to the Secretary of Defense, then to the Research and Development Board, the Munitions Board, the House of the Budget and the White House. If they survive the administrative maze and gauntlet of civil servants, aircraft manufacturers may eventually get a letter of intent for more business. In some cases still another step—the Joint Weapons Evaluation Board—is added to the maze.

The inter-service rivalry that enhances the military administration when they face in public prints are not in their own interests. In most cases it is the methods the civilian use to control each other in the press rather than the basic arguments that are shown. There is real danger that in attempting to curb some of these methods, the healthy rivalry and technical competition in necessary to military progress may be stifled.

There are disturbing signs that an attempt may be made to restrict military by establishing a rigid censorship of military information that would limit surface restrictions. One of the new additions to the top Pentagon public relations hierarchy is a specialist on wartime censorship.

### Censorship Plan

The new Pentagon public relations policy has not yet emerged from the fog of administrative procrastination but there are some revealing glimpses of what may come. One group is known to have planned a supposedly planned review of all information relating to government, technical developments, the state of the National Military Establishment, etc. This would be done with a goal of achieving a complete security blackout within two years.

Such a blackout might lead the Russians back a bit further to fill in their communications on our military strength. On the other hand, however, who have studied the Canadian spy ring wonder how much extra effort would be required for that plan to overcome a public relations blackout. Meanwhile, such a blackout would prevent the American people from getting accurate news from a Pentagon hand-out as what was being done with the billions contributed for defense.

Recent history of military appropriations has indicated that groups which do not have widespread public support do not live well on Capitol Hill when they come to be heard looking for money.

Smoking victories of the Air Force in its legislative battles during the past two years are ample proof that you need public support just off when appropriation bills roll around. Perhaps one of the greatest of the Johnson regime at the Pentagon will be the manner in which it balances severely against the need for latest information on what is happening to public opinion and how much defense it is really buying.

MICRO...first name in precision switches

MICRO precision switches have long fulfilled the need "AN" engineers for aircraft design. Their positive, dependable performance combined with utmost economy of size and weight. For hard hats are a few of these switches, housings and actuators which MICRO SWITCH has built to conform to Army-Navy recommended specifications. For complete information visit your nearest MICRO SWITCH branch office or sales representative.

## MICRO...A Complete Line of "AN" Precision Switches for Aircraft Use!

- 1 Light weight, rugged, aluminum-housed switch (MICRO B2V-78G5T1) with roller plunger actuator. Designed to conform to **AN2218-2**.
- 2 Sealed plunger housing (MICRO SVB1) for enclosing one or two MICRO V3-I switches. V3-I conforms to **AN2326-1**.
- 3 Light weight, rugged, aluminum-housed switch with sealed plunger (MICRO B2V-78WTEL). Designed to conform to **AN2317-2**.
- 4 Aluminum housing with roller arm actuator (MICRO LMR1). Conforms to **AN2323-1**. Designed to enclose basic switch (MICRO B2-R31) which conforms to **AN2310-1**.
- 5 Aluminum housing with rotary actuator (MICRO 1YK1) for enclosing MICRO V3-I switch. V3-I conforms to **AN2326-1**.
- 6 5" plunger basic switch (MICRO B2-785T). Conforms to **AN2315-1**.
- 7 Plunger basic switch (MICRO B2-R31). Conforms to **AN2310-1**.
- 8 Pie plunger, split contact basic switch (MICRO B2-3YT). Conforms to **AN2316-1**.
- 9 Rotary arm actuator bracket (MICRO S-107B2RH).

Conforms to **AN3170-1**. Designed for use with basic switch (MICRO B2-R31) which conforms to **AN2310-1**.

- 10 Small, high capacity switch (MICRO V3-I). Conforms to **AN2326-1**.

11 Actuator bracket (MICRO B2721A). Conforms to **AN2166-1**. Designed for use with basic switch (MICRO B2-R31) which conforms to **AN2310-1**.

12 Actuator bracket (MICRO B2721B). Designed to conform to **AN2166-1**. For use with basic switch (MICRO B2-R31) which conforms to **AN2310-1**.

13 Actuator bracket (MICRO B2721C). Conforms to **AN2167-1**. For use with basic switch (MICRO B2-R31) which conforms to **AN2310-1**.

14 Elementary action toggle switch (MICRO 1ATL). Designed to conform to **AN2325-1**. Combines two MICRO V3-I switches which conform to **AN2310-1**.

15 Roller lever actuator for bracket (MICRO AD5721B). Conforms to **AN2165-1**. For use with basic switch (MICRO B2-R31) which conforms to **AN2310-1**.

## NEWS DIGEST

### DOMESTIC

Capital Airlines indicated plans to ask Civil Aeronautics Board for a transcontinental through route from New York and Washington to Los Angeles and San Francisco via Pittsburgh, Cleveland, Elkhart, Chicago, Omaha, Denver and Salt Lake City.

Arthur E. Smith, 37, was named chief engineer of Pratt & Whitney Aircraft division of United Aircraft Corp., according to the Los Angeles V-12 Wilsons. Smith, recently chief engine test engineer, joined P&W in 1915 as a test engineer. He became project engineer of the B-2800 engine in 1948 and later was chief engineer of the water turbine Ramon City, Mo., plant.

W. R. Grace & Co. sold 70,000 shares of Eastern Air Lines common stock, presumably due to its acquisition of 75,000 shares of National Airlines, and EAL, respectively, for which it must have CAB approval.

Civil Aeronautics Administration in cooperation with the Air Line Pilot's Assn., is conducting a survey to determine what steps can be taken to remedy deficiencies in cockpit visibility of transport aircraft.

Vice Adm. Arthur V. Radford was appointed to succeed Adm. DeWitt C. Ramsey as Commander of the Pacific Fleet. Radford, who became a full Admiral in May 1948, is a Naval aviator and commanded carrier task force groups in World War II.

### FINANCIAL

Fusco Helicopter Corp. reports net income before taxes of \$50,660 for year ended Dec. 31, 1948, as sales of \$2,777,586. Working capital at year-end was \$159,926, and backlog was \$4,617,668.

Spery Corp. reports profit of \$8,770,513 for 1948 on sales of \$120,289,852. Unfilled orders and letters of intent at the end of February, 1949, totaled about \$162 million.

Solar Aircraft Co. reports net income of \$881,361 for nine months ended Jan. 31, 1949, on sales of \$12,416,055.

## INDUSTRY OBSERVER

Glenn L. Martin Co. is trying to attract the Air Force in a turboprop version of its XB-45 turboprop bomber. Second XB-45, powered by an GE Allison J13 turboprop, was recently delivered to USAF. Martin's new version of the XB-45 would be powered by four turboprop engines with dual exhaust rotating propellers.

Douglas Aircraft Co. is now building an X-1 supersonic research plane at its Santa Monica plant. Contract originally was a design study but final design has now been determined and construction of the plane is now under way. Other Douglas experimental projects include: prototype of a new Navy attack bomber, a supersonic Navy fighter and design studies for a transonic jet jet bomber for Navy carrier duty.

Chrysler of the Glenn L. Martin Co. has developed a new three-manual outboard for testing rotation of aircraft. Component can be readily applied to fabric and will withstand numerous landings and dry dockings without any reduction in three-manual quality.

Air Force is facing serious deficiencies in maintenance standards for large aircraft. Ground handling equipment for the C-47 is presently out-of-date. When B-36 groups move from the Coast to Ft. Worth plant of Convair, AFM, the ground equipment problem will become acute. Due to Boeing's size, not even standard USAF towing tractors can be used on the B-36. Military Air Transport Service is also active in need of adequate field maintenance stands for its largest transports (Boeing C-47 and Douglas C-74).

MAVIS has recently issued its maintenance procedures as a result of operational experience gained on the Berlin shift which indicates that engines and their engines the most frequent replacements.

Goodrich is still the big problem in the guided missile field. Several aircraft companies have developed missiles capable of operations over a 500 mi. range but so far no satisfactory method has been devised for guiding the missile into a possible target at the end of its journey. Meanwhile considerable progress has been made in stabilization and rough directional guidance of missiles.

Canadian government has appropriated \$350,000 for an aerodynamic research laboratory, including a supersonic wind tunnel, at the University of Toronto.

Australian navy has placed another order for F4U Corsair carrier-based reconnaissance planes with Ferry Aviation Ltd. of England. Assembly of the Corsairs will be done at the newly established Ferry plant in New South Wales. Ferry has sold the same type to the Canadian, Dutch, and British navy.

U.S. Air Force pilots have flown the Douglas AD-1 Skyraider in simulated combat against the North American F-84. The fighter was actually shot but observers were impressed by the ease with which the Skyraider outmaneuvered its opponent with the aid of its large dive flaps. USAF is considering the Skyraider as a low level attack plane to fill a current gap in its operational staff.

Al-Warner Flying Center of USAF at Wilburhampton, Ohio, has designed an automatic glide path flow-out device for use in completely automatic landings of jets in reverse. Straight glide path now used on standard ILS equipment results in extremely hard landings. The automatic flow-out consists of an extremely sensitive altimeter inside the cockpit which transmits automatic control from the glide path to the altimeter as the plane approaches the runway threshold. The sensitive altimeter is hooked into the auto-pilot to flap out the rate of descent until it reaches zero rate at the instant of landing.

Canadian Ltd. of Montreal is thinking about designing a feeder liner for use in northern Canada and other areas of the world where surface transportation is poor. Canadian interest projects include a small fleet of 100 F-86A jet fighters for the RCAF under license from North American Aviation, Inc., and production of Canadian four transports.

## Vinson Asks Increase in 1950 Plane Funds

### Urges \$778 million over defense budget to buy 1220 more Air Force and Navy planes.

By Robert Hote

A brief in military aircraft procurement funds for fiscal 1950 by \$778 million to buy an additional 1220 planes was strongly urged by Rep. Carl A. Vinson (D., Ga.), powerful chairman of the House Armed Services Committee.

Vinson's proposal was made during a bitter discussion in the House floor of the \$15 billion defense budget outlay proposed by President Truman on reauthorization of the Budget Bureau.

**► Procurement Record.**—To the aircraft industry, Vinson's plan would mean an increase in military aircraft procurement funds for fiscal 1950 to \$2.9 billion, about \$200 million more than the past war record total of \$2.7 billion raised by the 80th Congress for fiscal 1949.

The \$20 billion would buy 3733 planes compared with 3670 planes contracted for under the fiscal 1949 budget.

Proposed boost in aircraft procurement funds was part of Vinson's overall plan recommending a \$3.5 billion increase in the defense budget to partially offset a \$2.5 billion drain by the Budget Bureau in the final version of the defense budget proposed by the Joint Chiefs of Staff. The \$3.6 billion increase roughly would be split: U. S. Air Force, \$500 million; Navy \$545 million; and Army, \$515 million.

**► Air Force—Procurement budget of \$1,900,000,000 to buy 3170 planes in fiscal 1949. This compares with \$2,045,000,000 and 2417 planes for fiscal 1949. Group strength would be at 37 combat group plus 15 separate squadrons. This**

compares with the Truman budget mark of 45 groups plus 10 squadrons and the USAF strength on Jan. 1, 1949 of 39 combat groups plus one precision group as the Berlin crisis and 19 separate squadrons.

**► The additional 3000 missions (now estimated for Universal Military Training) urged by Vinson would be split as follows:**

**► Procurement—\$15 million to buy 702 additional planes. Vinson said if the entire \$500 million were used for procurement a total purchase 1110 additional planes. Some air power advocates on Capitol Hill favor using the entire \$500 million for procurement; some planes ordered now will not require personnel or maintenance funds until 1951 and the modernization of USAF equipment would be accelerated at the rate originally planned under the 70-group program.**

**► Operations and Maintenance—\$215 million.**

**► Personnel—\$94 million to boost USAF**

strength from 415,000 in the Truman budget to 410,000 for the 57 group level.

**► Research—\$36 million.**

Vinson attacked the lack of uniform in power policy in the Truman budget, pointing out that the USAF outlook toward the 45 groups specified by the President has already wasted considerable sums of the USAF funds appropriated last year and has delayed the start for a 79-group schedule and C-54's until 1954, regardless of what fiscal year Congress takes that spring when the military appropriations bill comes up for approval.

**► Navy—Annual procurement budget of \$1,039,000,000 to buy 1161 new planes is recommended. This is an increase of \$345 million and 578 planes over the Truman budget. It compares with \$113 million and 1213 planes for fiscal 1949. Under the Truman budget for fiscal 1950 the Navy would be authorized to buy only 545 new planes at a cost of \$637 million. Vinson pointed out that his administration has still well short of the \$1.5 billion plan for a new program required by the Navy to provide the 1700 new planes needed for a full strength Naval Air service.**

**► Increase in Naval personnel from 411,000 approved by the President to 595,000, and a \$38 million boost in operations and maintenance funds were recommended by Vinson to put two main groups with six groups, 30 destroyers, and additional patrol vessels into active service. A \$17 million increase in Naval research was urged to reduce a Budget Bureau cut that liquidated cut projects for prototype development of one planned aircraft type (probably a twin-engine carrier-based anti-submarine plane); a new guided missile, as well as new electronic equipment, powerplants and aircraft for aircraft.**

Vinson said the President's budget would mean a reduction in Naval Air strength of 418 planes, three carriers and one Naval Air fleet. Naval plane strength would drop from the 1183 planes now in service to 7765.

**► Army—An \$84 million boost to buy an additional 510 supersonic subsonic aircraft. The Budget Bureau says low-level attack aircraft, personnel increase to 711,000, including more airborne air forces requiring transport aircraft and \$45 million for modernization of an additional 493 tanks were urged by Vinson.**

Vinson's program will probably appear in the recommendations of the House Armed Services Committee as a Part A bill. It is an attempt to bring the floor. In whatever manner it is presented it is sure to take a better fight than Truman administration suggestion who are pledged to build the \$15 billion defense outlay as well as the economy

## More B-36s

U. S. Air Force cancelled its procurement plan for 44 Boeing B-36 bombers to buy 16 more B-36s. The B-36 is now in production, the 18th and 19th at Convair's AFSC, Tex., will be complemented by two additional B-36 bombers groups and two B-36 strategic reconnaissance groups in the future.

**► The new Congress order brings the total of B-36s ordered and on order to 139 not including the prototype X-36-36. Convair has completed nearly 60 of this number and is making completed bombers from its Ft. Worth plant at an average of one per week.**

**► The Model 44 of the new B-36 will be equipped with the jet engine jet turbines burning four General Electric J-47 turbojet engines in addition to the standard piston engines at Pratt & Whitney Wasp Major 3500 hp piston engines. Total cost of the additional 16 B-36s is estimated at \$100 million, of which a little more than half will be added to the current \$100 million of 1950-51 budget. The balance going for procurement of the aircraft.**

USAF will increase the strength of its heavy bomber and strategic reconnaissance groups from 18 to 30 planes each as a result of the ad-

ditional B-36 orders. Two bomber groups of 18 B-36s now in operation, the 18th and 11th at Convair's AFSC, Tex., will be complemented by two additional B-36 bomber groups and two B-36 strategic reconnaissance groups in the future.

**► The new Congress order brings the total of B-36s ordered and on order to 139 not including the prototype X-36-36. Convair has completed nearly 60 of this number and is making completed bombers from its Ft. Worth plant at an average of one per week.**

**► The Model 44 of the new B-36 will be equipped with the jet engine jet turbines burning four General Electric J-47 turbojet engines in addition to the standard piston engines at Pratt & Whitney Wasp Major 3500 hp piston engines. TWO VERSIONS OF GRUMMAN GUARDIAN

Fast flight picture of the first role played by the Grumman Guardian is shown above. XT100B (top) is a special version equipped with subsonic electronic operations. The large radars behind the belly houses a special radar unit for the

Both experimental models are powered with a Pratt & Whitney R-2800-40 engine. Production models to be known as the AP-40 and AP-41 will be powered by the R-2800-40 engine. Navy has ordered 75 of the AP series.

Morgan Schaeffer, vice president \$75,446 (plus a \$1260 pension fund payment). Total salary for directors and officers salaries and fees: \$301,494 (plus \$53,490 in pension fund payments). This exceeded the 1947 audit fee of \$25,534, due primarily to the large fee for vice president for sales in 1948: \$104,700 (plus a salary of \$87,735).

► **Continental Aircraft Engineering Corp.**—L. R. Crahan, chairman of the board, \$50,580 (plus \$6932 for retirement benefits); L. A. Schaeffer, president, \$60,580 (plus a \$10,255 retirement benefit payment); William Schaeffer, executive vice president, \$48,580 (plus \$3521 retirement payment); R. Chislow, fiscal, vice president, \$27,180 (plus \$2647 retirement payment). Total salaries for directors and officers salaries and fees: \$211,686 (plus \$34,152 in payments for retirement benefits).

► **Piper Aircraft Corp.**—William C.

Meyer, director, \$18,713 (plus \$82,000 in bonuses and/or shares in profits).

► **Korn Aircraft Co.**—J. C. Clark, Ryan, \$16,441 (aggregate remuneration); earnings of two vice presidents below the \$25,000 level was also reported: L. J. Pennington, \$13,625 (C. G. Wood and \$13,775).

► **Lockwood Heller Boeing Co.**—William B. Chislow, \$107,120 (plus \$12,760 in retirement fund payments); H. H. Tindler, chairman of the board, \$8,873 (plus \$2522 in retirement payment); R. C. Boase, secretary/treasurer, \$45,171 (plus \$3799 in retirement payments); A. M. Dora, vice president, \$58,375 (plus \$1721 in retirement payments); J. H. Lock, vice president, \$58,375 (plus \$2720 in retirement payments); L. M. Klinefelter, chief accountant, \$60,461 (plus \$4410 in retirement payment); W. R. Tindler, vice president, \$50,375 (plus \$2143 in retirement fund payments).

► **Reynolds Aircraft Corp.**—W. Maga, president, \$85,000 (plus \$72,197 in bonuses and/or shares in profits) (plus \$17,320 in pension fund payments); Landon Meyer, vice president, \$18,000 (plus \$23,641 in bonuses and/or shares in profits) (plus \$5712 pension fund payments); Harry Vengas, secretary/treasurer, \$20,000 (plus \$21,900 in bonuses and/or shares in profits) (plus \$6887 pension fund payments); Joseph Peapack, vice president, \$20,000 (plus \$81,000 in bonuses and/or shares in profits) (plus \$6,778 pension fund payments); Victor Carabona, vice president, \$19,995 (plus \$23,000 in bonuses and/or shares in profits) (plus \$4786 pension fund payments).

► **Shen Supply Manufacturing Co.**—Director and officer earnings aggregated \$104,946 with no indicated earnings over \$25,000, company reported.

First flight photos of General's DeLia Wing Model 7602 reveal close cousin of the ultralight. This photo, flown up from 15 miles above the shore, shows the extremely high angle

DELIA WING PROTOTYPE FLIES at steep ascent to 10,000 ft and the top end of the climb and the tip of the ultralight on the Alvin 115 ft engine. Model flight tests reduced some difficulties in full scale

which have been observed through all portions of the climb and instead of wing and allows on the corner DeLia Wing design

## Aircraft Shipments Decline in January

Shipments by 11 aircraft companies in January totaled 2,227,000 airline pounds. Bureau of the Civil and Civil Aeronautics Administration report. For the first time since July of 1948, the report includes airline weight of military aircraft delivered.

Under current method of reporting, airline weight is the only indication of overall business in military shipments not reported by mail or value. January airline weight took a considerable drop from the December weight, 3,865,400 lb. Both military and civilian shipments dropped. Military airline weight for the first month this year was 1,256,660 lb., January 1,944,300 lb. Civilian airline weight December, \$8,800 lb.; January, 768,760 lb.

► **Civil Shipments.**—Total of 166 civilian aircraft, valued with parts and other products at \$7,411,179, was shipped in January, compared to 235, valued with parts and other products at \$11,414,728, delivered in January. Civil shipments in January included nine transport aircraft and 151 miscellaneous types.

January backlog of transport planes was 194, down for from the preceding month. This is the lowest transport plane backlog manufacturers have shown, the figures declining steadily from 199 reported in January, 1948.

► **Regain.**—Military aircraft shipments by total horsepower increased slightly in January over December, 2,256,500 hp against 2,415,000 hp. This brought an overall gain in horsepower from 2,245,100 hp in January to 2,645,900 hp in January, despite a drop in the horsepower of civilian aircraft from 125,500 hp in December to 112,600 hp in January.

Civil engines shipped in January numbered 185 (520 in December), valued with parts and other products at \$3,215,297, compared to value of shipments of \$3,420,024 in December.

## Eastern's Earnings Tops in Industry

Eastern Air Lines continued to show the best earnings record among the major carriers with the release of its 1948 annual report.

The company reported net profits of \$2,946,871 or '96 cents a share for 1948, compared with a 1947 net profit of \$1,258,196 or 53 cents a share.

Eastern's accomplishment was not without a few aches and pains in income. EAL, along with American, had the difficulties of securing a com-

pany service rate, devoid of subsidy, during 1948.

► **Depreciation.**—Foster's (the reported) EAL figures showed an after depreciation charge of \$6,609,562, compared with \$5,626,602 for 1947. The management continued the policy of using a slow year depreciation base for 1948. The depreciation expense compared with the seven year period followed by Civil Aeronautics Board in its most late determination.

The after-taxative accounting followed by the company in its report to stockholders is revealed in the position for Federal income taxes. Instead of the normal 55 percent tax in effect, the management provided for 39 percent. The company's net earnings for the first year were actually much higher than reported to stockholders.

## Committee Cuts CAA Budget

House Appropriations Committee slashed \$20,151,616 from the fiscal year 1949 CAA budget, set at \$213,000,500. Budget, since needed for Civil Aeronautics Administration for the coming fiscal year by the Budget Bureau, leaving the administration with five fiscal year appropriations totaling \$197,875,685.

With the observation that CAA assets "should be borne, in part at least, by the system," the committee slashed CAA's total contribution by \$11,191,893 from the \$121,000,000 proposed by Budget Bureau to \$119,875,685 and its total contract authorization by \$5,203,000 from the Budget Bureau's proposed \$125,000,000 to \$119,800,000.

► **Want CAA's.** The committee also slashed Civil Aeronautics Board's coming year appropriation by \$19,506,000 from the \$139,000,000 recommended by Budget Bureau to \$119,494,000. Keeping the Board 50 new personnel, the committee suggested that the answer to CAA's backlog is improved administrative control of its "generally increasing appropriations."

Following are details on funds allocated CAA by the House committee:

► **Salaries and expenses.** \$54,602,335. From \$13,919,949 below for 1947, \$1,005 proposed by the Budget Bureau, but \$11,919,301 over CAA's current year appropriation. The allocation includes \$18,384,199 for operation of 115 existing and 57 new control towers, 17 that will be re-constructed, and 12 new control towers that are yet to be established.

► **Air navigation facilities.** \$16,195,000.—From \$18,000,000 below for 1947, \$1,005 proposed by the Budget Bureau, but \$11,919,301 over CAA's current year appropriation. The allocation includes \$18,384,199 for operation of 115 existing and 57 new control towers, 17 that will be re-constructed, and 12 new control towers that are yet to be established.

Another manifestation of the company's real earning power is found in the ship improvement in its net worth. At the end of 1948, the company's balance sheet reported \$10,588,284, compared with only \$7,135,131 a year earlier.

► **Cash.**—Treasurer's 1948 management also took advantage of its favorable banking credit accommodations by showing down the full current percentage under the terms, \$16 in stock at a dividend rate of only 10 percent. The management, to provide the company with an added margin of safety. Virtually offsetting this bank credit are shortfalls, and noticeable shortfalls which very likely will be charged to the bank later. This bank loan is to be repaid in twelve equal quarterly installments.

over CAA's current year allocation at \$22,440,492 and \$12,341,499 contract authorization.

► **Air navigation development.** \$7,000,000.—\$6,510,800 cash and \$4,000,000 contract authorization. This is a reduction of \$1,000,000 from the Budget Bureau's recommended \$10,000,000 cash and \$4,000,000 contract authorization, and compared with the annual \$10,000,000 allocated to the current year. The committee explained that such money allocated after Budget Bureau's recommendations had been shown that \$7,000,000 would be sufficient to maintain the long range air navigation flying program over the next year.

► **Technical development.** \$4,410,000.—a reduction of \$114,000 in the \$4,500,000 recommended by Budget Bureau. The committee recommended that "some of the work now being done under the program is of doubtful value."

► **Aircraft maintenance.** \$5,000,000.—\$4,500,000 cash and \$16,208,000 contract authorization. Budget Bureau recommended \$5,000,000 cash and \$16,700,000 contract authorization. The \$500,000 drop was an administrative item. Almost all—\$1,500,000—of CAA's cash allocation is for the liquidation of contracts. CAA's current year report allocation is \$1,000,000 cash and \$17,000,000 contract authorization. In addition, the committee allowed \$5,000,000 for international airports at Fairbanks and Anchorage in Alaska (the current report recommended by Budget Bureau).

► **Weather.** \$10,000,000.—\$1,271,800, a reduction of \$114,000 in the \$3,212,500 proposed by Budget Bureau. Of the total, \$1,216,800 is for operation and \$1,000,000 for building construction work started this year.

How many looks from air at night, these are in background to appear more

## Los Angeles Airport FIDO Shown

New fog-dispelling system demonstrated for first time, although operational use is still several weeks away.

**LOS ANGELES**—On March 18, 1972, two teams conducted a runway and approach area at Los Angeles Municipal Airport, in the first public demonstration of the new thermal fog dispersal system considered development of winter FIDO, was set off by debris alone.

The \$541,900 heater system was the first ever to be used by the military force during the winter fog which is the result of the system to produce cloud height despite fog, 100 ft. to 100 ft. in the approach area, 100 ft. in the terminal area, and 100 ft. in the runway area, and ranging from 100 to 150 ft. on the rest of the runway.

Five major airlines using the airport, American, TWA, United, Western, and Pan American, have authorized the \$541,943 advanced by the Los Angeles Department of Airports to go with a federal airport grant of \$495,450. The airlines have agreed to pay the city's share in five years and pay operation and maintenance costs of the system.

It will not be put into regular operation for several weeks until CAA and Weather Bureau personnel are trained to operate it.

The system burns No. 2 diesel oil, the cheapest available. It can burn oil enough for a plane landing at cost of \$75 to \$80, depending on fuel density. For a 50 percent plane that would be a cost of about \$150 a passenger. Airlines expect it to pay off in savings of cost of transportation of passengers from landings at most airports alternate routes, and in operating an airline per annual due to fog conditions.

Sold forces to that off place of the Bureau have interests have been erected

at selected intervals along the lines of the runway.

Heater and under ground fuel system have been developed by Todd Skyray Corp., Glendale, California. The system consists of a new thermal fog dispersal system considered development of winter FIDO, was set off by debris alone. It is made of the rest of the runway.

The line of heaters extends 6000 ft. along both sides of the runway, and extends 3000 ft. along the approach area at the end of the runway.

High intensity runway lights (100,000 candela) with five stages of brightness, and a deep line lighting system, together with other and ILS are operated by Los Angeles officials to make the airport the "best equipped of winter airport in the world."

Participating in the first public demonstration were Harold Jones, CAA member and former Los Angeles attorney; Clinton Young, Los Angeles airport development manager and former CAA member; Joe Maxwell, south region CAA administrator; Mayor Fletcher Brown of Los Angeles; Robert L. Smith, airport commission president, and other officials.

## Eisenwein Named

August C. Eisenwein, former vice president and general manager of Aviation Maintenance Corp., Van Nuys, Calif., has been named executive vice president of Piper Aircraft Corp., Lock Haven, Pa.

## Fairchild Produces New Jet Engine

Powered Engine Airplane Corp.'s Ranger division has begun deliveries to the Navy of production models of the F-46, an "supersonic" turbojet power plant, the company's annual report data claim. Production order was received in January, 1970, for the engine, and negotiations are in progress for an additional quantity.

While the Ranger division was starting to build its first engine production contract, the Aerojet division at Azusa, Calif., completed its production contract on the Rocket with the delivery of the 77th and last plane. Deliveries of the first of 135 G-119s are scheduled to begin this year.

**Lower Sales**—Revenue of the complete line in September of the fiscal year, Fairchild's 1968 income of \$50,650,073 was \$1.7 million more than \$48,947,000 income of \$38,704,514. Profit also was lower, \$1,352,582 in 1968 against \$1,542,412 in 1967. It was Fairchild's income, however, profitable year.

Worked reported in 1968 was all about \$1.5 million from the previous year. But part of this is reflected in the withdrawal from current assets of \$1,185,093 for plant expansion and acquisition. This is a one-time cost of the company's properties to spend in 1969 for this purpose.

**Employment**—Employment and backlog rose during the year. Employees at the end of 1968 were 14,169 compared to 15,042 on Dec. 31, 1967. Backlog today reached from \$48,700,000 to \$44,700,000. Military production orders reached \$7.5 million at the end of the year. The \$5 million order for 100 T-31 training, the largest order for C-119s. Military equipment and development work is about 15 percent of the total. The C-119 backlog has about 55 percent of 1968 sales.

Other Fairchild activities as reflected in the report:

**Aircraft Division** has an order for eight C-119 type planes for the Marines, in addition to the Air Force version. More planes are designated BQ-1. Division also is working on the X-3013 Pack Plane prototype, and on tactical landing gear.

**Ranger Division** is developing three different types of power plants, one each for Bureau of Aeronautics, Bureau of Ordnance and Bureau of Ships. Subcontracting backlog about \$15 million has been received from General Electric for F-47 engine components.

**Pipeline Power Division** is in production on the Lock (pilot) assets for the Air Force and has an order from the Navy for an experimental test quantity. A "new and distinctive guidance system," designated "Skydial," has been

developed by the division with the Naval Research Laboratory working as consultant.

**Planned Power Division** closed out its F-47 inventory during 1968. Last month the power Fairchild design, F-47 received a Civil Aeronautics Administration Approved Type Certificate, but the power has been shown Fairchild contractors it would cost \$25 million to achieve satisfactory production.

## New Transactions Reported by SEC

Purchase of 500 shares of Piper common stock by William T. Piper, president and chairman of the board of the company, was disclosed by the Securities and Exchange Commission. This gives him holdings of 500 shares of Piper's 146,731 shares of preferred stock, and 500 shares of the common stock, 54,816 shares of common stock.

Other aviation transactions reported by SEC for the end-February to mid-March period:

**Pan American**—Pioneer Corp.—Pioneer Aircraft, Denver, Colo., purchased 100,000 shares, making a total holding of 1,000,000 shares. Pioneer Aircraft, Denver, Colo., purchased 100,000 shares, making a total holding of 1,000,000 shares. Pioneer Aircraft, Denver, Colo., purchased 100,000 shares, making a total holding of 1,000,000 shares.

**Boeing**—Boeing Aircraft Co.—Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares. Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares.

**Boeing**—Boeing Aircraft Co.—Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares. Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares.

## PAA Settles Strike

To settle a 14-hour strike of 235 radio operators which interrupted its Atlantic and Pacific operations, Pan American Airways has given the strikers a wage increase to \$100.00 and a wage increase to \$100.00 per month.

In return, PAA hopes it has resolved the fact that before the strike the union had been on the strike at a "fairly good" level in an effort to secure a wage increase to \$100.00 per month and \$100.00 per month. The arbitrators members of the

Transport Workers Union of America, demanded the high wage increase pay to offset their loss of central unionization due to the airline's successful unionization of equipment at its plant with pre-empted radio telephones. The union originally had asked for a 100 percent monthly pay boost.

PAA promised a new contract to try to place displaced employees in jobs comparable in pay and responsibility wherever possible. Those accepting alternate jobs will lose 20 percent of their seniority rights quickly.

TWU has disclosed that it still is ready to continue its fight for a line which will prevent use of radio telephones as over-the-air routes. It claims radio telephony is a quality and mass means of communication at sea (AVIATION WEEK, Mar. 20).

PAA officials have stated that radio telephony is actually more efficient, is favored by the pilots, and will be used successfully for 10 years by domestic airlines.

The chairman TWU's case to limit use of radio telephony is "an attempt to force the airline to pay a small group of men. Notwithstanding the fact that your radio does not require a flight radio officer, these men seek to restrict an flight radio operator in Pan American's employ."

TWU asserts, however, that although it will try to stop use of radio telephony on over-the-air routes, it has never suggested that radio operation be employed for planes which use radio telephones.

**Boeing**—Boeing Aircraft Co.—Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares. Boeing Aircraft Co., Seattle, Wash., purchased 100,000 shares, making a total holding of 1,000,000 shares.

NEW AIA HEAD

Admiral DeWitt Clinton Keady, new commander of all U.S. Forces in the Pacific, will take over as president of the North American Air Force on July 1. He is scheduled to arrive from the New York City, where he will succeed Maj. Gen. Oliver F. Edwards who left AIA to become chairman of the Board of Maritime Agencies, Inc.

## TEMCO Sales Up

Teas Engineering & Manufacturing Co., Dallas, made several gains in the financial market in 1968, reporting net earnings of \$521,251 for the year, an increase of \$10,000,000.

Sales volume increased 71 percent over 1967 sales, and percentage of net profit in sales to 1967. Dividend of 75 cents a share was paid on earnings of 20 percent in 1968. Earnings for the year 1968 were equivalent to 57.74 a share of common stock outstanding, compared to earnings of \$1.74 per share in 1967. Dividend of 75 cents a share was paid on earnings of 20 percent in 1968.

Contracts for overhaul, modification and conversion of military aircraft for the U.S. and foreign governments totaled \$1.5 million in total sales. These included a large percentage of overhaul on G-56 and in the Berlin airlift. Other business included continued production of the two place ST-10 aircraft (personal plane, and development of a basic trainer, whose low initial and operating costs is expected to make it a good selling item to foreign countries with limited budgets for government aircraft.

President Robert McGoffin and executive vice president and treasurer H. L. Hovine, point out that plant facilities of the company are leased from the Naval industrial reserve (major portion of Plant A, former Naval Air Station, Arlington, Va.).

Prospects for continued operation after that date, based on present indications of future business, are good. Company may require facilities located within 120 miles of the plant.

The report also contains data for the year include orders from the Colombian government for the awarding aircraft, and those for the bomber components.

## Airport Purchase

University of California has announced purchase of the University Airport at Davis, Calif., with adjoining Smith Farm, to provide facilities for agricultural flight including landing and improvement of agricultural aircraft. The field was recently owned by the Harte Airport Trust, is an excellent "Class C" airport.

The University college of agriculture and agricultural experiments station has already sponsored demonstration flights at the airport by fixed wing planes and helicopters in agricultural use. The report will also be used for experiments in the shipping of perishable farm products, in cooperation with the Air Cargo Institute of California.

# ENGINEERING

Unit, left top, is one model of 60 sec. wide-band Melpac intermediate frequency amplifier built at National Bureau of Standards for Navy Bureau of Aeronautics. It was

substitution tubes and compact assemblies of miniature parts. Banks of amplifiers, left bottom, use printed electronic elements throughout. Adjusted are three pairs

for single-point amplifier stage together with completed stage assembly. Plans, right, depict typical pilot line set up to evaluate production line problems.

## Subminiatures Call For New Skills

High consumption of very small electronic equipment in expendable missiles calls for efficient mass production.

Not content with "miniaturization" of electronic equipment for airborne installations, engineers are now striving "subminiaturization" of this equipment to reduce its size and weight.

But reduction of size and weight alone is not enough for tactical purposes. Since both accuracy and tactical qualities are essential, it is essential that subminiature electronic equipment have a high productivity.

The real use of this equipment, as seen in the accompanying illustrations, renders difficult the problem of its production. It is to facilitate the soldering, mounting and forming of these tiny components as a production basis that a new process has been initiated at the National Bureau of Standards in the Navy Bureau of Aeronautics.

► **Heat Problem**—An electronic assembly is considered subminiature when its volume is compared to a standard unit primarily expressed by the smallest available electronic tube. In taking the dimensions of this tube as the maximum, Bureau of Standards engineers design wiring and assembly that falls within one third of this limit.

Basic approach to that problem is to package the entire assembly in a single unit, rather than individual components, so that each assembly comprises a single plug-in unit.

This approach presents a major problem. Although the use of the unit is relieved by extremely small dimensions, the electrical lead cannot remain the same. This means that the lead to be discarded per unit area is increased enormously. A solution to this difficulty is the "porting" of the entire pre-wired bundle into NBS casting resin, developed during the war.

► **Material Data**—Since materials which are stable at high temperatures are required for miniature components and assemblies, loss of the quantity, available assembling materials may be used. Some of the high temperature radiating materials satisfactory for miniature assemblies are ceramics, vitreous enamels and vitreous bonded leads.

Low dielectric-constant ceramics, such as (MgO), are used in packages to assure insulation material. High dielectric constant materials are used in some not only as insulating material

around base materials but also as miniature, repetitive dielectrics. Ceramic dielectrics have been used throughout because of the potential security of loss in times of national emergency.

Facilitating the high dielectric-constant ceramic bodies into cylinders rather than cylinders that they would be in flat shapes. These cylinders are used to play a multiple role as capacitors, tube shields, stand-off insulators and base materials for printed wiring.

Because of the high heat encountered in subminiature electronic devices, high temperature wire is required in conjunction with special soldering or welding techniques.

► **Amplifier Reconfiguration**—The most miniature frequency amplifier chosen for reconfiguration embodies a type of critical circuit layout which represents the most logical problems. The reconfiguration amplifier was designed to have eight stages—four of stages, a detector, a video amplifier and a pulse follower output circuit; more than 95 decibels gain from the input to output of the detector, mixer and automatic gain control, a 60 sec. carrier frequency and

NOW...to control

liquid levels more accurately

Here's the **NEW**

## LEVEL CONTROL VALVE

Positively Controls Tank Levels for:

- Single Point Fueling
- Underwing Fueling
- Fuel Transfer Systems
- Pressurized Drop Tanks

1 1/2" bottom-filling valve to meet an Republic's 7-14 Thunderbolt.

1/2" top-filling valve with mounting flange to meet an Republic's P-51 Mustang.

This new PARKER valve controls fuel tank levels far more accurately. Has balanced pilot valve which operates independently of flow rates or pressures. Actuated by internal float. Offered in both top-filling and bottom-filling models.

**Compact**—light weight—1 1/2" size weighs 1 1/2 lb., 1 1/2-1 3/4" size weighs 1 lb.  
**Low Pressure Drop**—1 1/2" size, 4.8 psi. at 20 gpm., 1 1/2" size, 0.5 psi. at 20 gpm., 3.8 psi. at 200 gpm.  
**Suitable for high pressure systems**—0 to 50 psi., 75 psi. good

**Waterproof**—temperature range—55° to + 160° F.  
**Positive shut-off and reopening action.**  
**Thermal relief protection.**  
**Inherently-viable part designs.**  
**Designed for easy maintenance.**

### Other Parker Aircraft Products

- Tube fittings—40 standard and bending types.
- End Valves—shut-off, isolates, including over-draws.
- Hydraulic Valves—check, relief, restrictor, shuttle, etc.
- Air and Vacuum Valves, Solenoid Check Valves.
- Engine Pumps, Fuelcocks, Drain Cocks
- O-Rings of Approved Compounds

**THE PARKER APPLIANCE COMPANY**  
17518 North Avenue, Cleveland 13, Ohio  
Parks, Cleveland and Los Angeles

Special tube capacitor, left, for use at high operating temperatures found in electronic assemblies are made by coating high K dielectric ceramic tubing with silver-

pigmented paint. Individual lengths are heat-dried under infrared lamps before being at 1300 W. Levitated alloy pump, right, prints electronic circuits directly on ceramic

tubal surface. About 90 percent of die-cast for each stage of amplifier is milled into an ceramic cylinder which slips over semiconductor electronic tube

a half-width of 10 mil, and an assembly readily adaptable to mass production.

Two methods of fabrication were employed for the manufacturing of amplifiers. One case (assembly A) was developed using a maximum of semiconductor component parts based on standard design. A second assembly (assembly B) used a maximum of printed circuits.

Design of One Type—Assembly A was designed so that it could be readily manufactured with techniques similar to those currently employed in the electronic industry. The circuit for this amplifier is conventional and all stages are laid out in a straight line on a metal plate. 10 in. wide with the interstage coupling networks located between adjacent printed tubes.

The ceramic substrate bases are coated with high temperature resistant wire and have adjustable powdered contact coats which may be tuned by a screwdriver. To dispense with separate bendable, the sections are inserted directly in the substrate holes. End plates of these forms are installed with the required pattern to interconnect the resistors and control elements when soldered into place.

Thermal-wound inductors are used for interstage coupling networks to eliminate coupling capacitors with their associated high capacitance to ground. The amplifier contains 30 inductors, high dielectric constant, ceramic bypass capacitors, most of which are located under the base of the vacuum tubes in ordinary unused space.

Most of the metal parts are light-gauge aluminum, responsive to metal Fincoflex finishing material to create a protective finish. The amplifier design provides for the assembly of pas-

sive thermal substrates to the main assembly at various points in the production line. Waxman says therefore not required to handle individual components but only large assemblies.

Flow over other than resistor and tube leads are used to connect components of this amplifier, remainder of the interconnections being applied by coated conductors. The use of the conductive of the shield can a 10 to 100 by 1/2 in. A, although an attempt was made to achieve the absolute minimum loss. Instead, components were made to facilitate production of an extremely rugged amplifier.

Second Type—Assembly B, the printed-circuit assembly, was made to the same general specifications as Assembly A, which was standard electronic components. Assembly B is packaged in a hermetically-sealed container approximately 6x2x2 in. long.

Basic design is characterized by an in-dustrial stage or subassembly type of construction, employing changes in the printed circuitry when necessary to alter the function of the stage. This subassembly type of construction requires only four additional connections between stages.

Typical steps in an assembly of first major parts: three printed ceramic parts and a vacuum tube. This design is based upon the use of a high dielectric constant ceramic cylinder which slips over the semiconductor vacuum tube.

On the surface of the cylinder is printed a major portion of all the capacitor sections and associated circuitry. A half-wound ceramic substrate form is attached to the semiconductor tube base and in the bottom of the ceramic cylinder surrounding the vacuum tube

A fourth element, a short ceramic cylinder of high dielectric constant, fits over the inductor form.

In the process of making electrical connections in the vacuum tube, all four parts are soldered simultaneously in an interlocking assembly.

Inside of the large ceramic tube is a shielded, serving both as a ground plane for the outside by pass capacitors and as a shield for the vacuum tube.

External of the ceramic tube is covered with high-temperature resistance on which a installed external shield coating is applied, resulting in a completely shielded individual assembly.

Printing Data—One of the important phases of the work being done by NBS for Rockwell is the development of high-temperature printed resistors. Since the high-temperature resistor problem will not be solved by a single advancement, this program is a continuing one.

Large high-temperature printing equipment for establishing circuitry on the special industrial ceramic parts has been designed and constructed. Conductive electrochromic have been developed as an alternate method of applying the required, multiple circuit elements.

This technique is useful in simple hand operations as well as in more electronic methods, for example, a specially modified hot-ink labeling machine may be used.

Other production aids and techniques to facilitate production of the amplifier have been developed for greater mechanization of printed circuit processing.

Experiments gained in this development program point the way toward even smaller and lighter printed and miniature component assemblies.

## New Tunnel Combines Speed, Altitude Tests

What is reportedly the world's first wind tunnel designed to develop super sonic speeds under conditions found at 50 to 80 mi. above the earth has been put into operation at the University of California.

The new test facility, made possible directly because of long studies taken in vacuum and jet pump development during the war, will permit study of fluid mechanics at supersonic speeds in a realm beyond reach of present tunnels.

Built with funds supplied by the Office of Naval Research, development of the project was begun in 1946 under the direction of Dr. R. G. Polson, professor of mechanical engineering at U.C.L.A., and E. D. Kist, research engineer.

Kist points out that, although this is a member of tunnels in operation which generate later-than-sound air streams, these will only give only those problems of supersonic flight directly met in service.

It also has been difficult to conduct data obtained from parameters sent into the upper atmosphere by rockets, because effects of such altitudes on the instruments themselves can't be accurately subverted.

The new tunnel, estimated to be capable of creating speeds four times the velocity of sound in pressures 100,000 times less than atmospheric, should eliminate many of the difficulties encountered.

Extensive low-pressure tests are conducted by a rotary jet vacuum pump system consisting of five stages of pumps requiring 3,500,000 Btu/hr. to operate. Pumps are almost as large as the working section of the tunnel, each of the first two stages being about 15 ft. long.

# Why Are More and More Aircraft Manufacturers and Operators Switching to Fenwal Fire and Over-Heat Detectors?

Units are hermetically sealed...weigh only 2 ounces each. Repeatable.

1. Complies with CAA Technical Standard Order C-11 in accordance with Society of Automotive Engineers Specifications AS-42L

2. Proven reliability.

3. Simple, low-cost installation.

4. No maintenance problems.

ON  
THE  
GROUND

This typical Pacific Western high-speed unit is fully enclosed, and has integral lubrication and cooling systems. This type of unit is available in a complete range of ratings and capacities.

The variable speed unit is available in modern aircraft development laboratories, for the engineering and testing of modern variable mechanical tests, are easily provided by Pacific Western high speed units.

Speed factors were designed into a Pacific Western gear box to test a new type of axial-flow compressor. In this application, input is 150 hp at 1600 rpm, output speed is 14,000 rpm. Pressure velocity is 15,000 ft/min, pressure velocity is 11,000 ft/min. Actually, this Pacific Western unit is capable of speeds up to 16,000 rpm—1½% makes per minute pressure velocity. That's fast for any gear box operating up to 10 hours at a time.

More than fifty years of experience, and the finest engineering facilities in the West, are ready to serve you at our 3 plants. In the aircraft field, our experience encompasses virtually every mechanical power-transmission problem in aviation—in the air and on the ground. Our technicians are constantly at work to extend known practices for the solution of unexplored problems.

Why not consult our staff of engineers on your current problems of mechanical power transmission?

Mean travel motion is 15 ft. in length and ranges up to 8 ft. in height. It has a test chamber about 5 ft. in diameter and 7 ft. long with a nozzle (test section) 4 in. in diameter. Additional development is expected to bring the nozzle up to 6 in.

The high velocity airstream which passes over the models in the test section can be either air or gases such as oxygen or helium.

To obtain pictures of airflow around models, particularly shockwaves, gas is forced through a screen charged with high voltage, coming to a glow, so that density or pressure variations around the model will be visible for observation and photography.

## New Test Procedure Devised For Fuels

A new technique, considered to be a major improvement in the evaluation of fuels on the basis of knock, ratings, has been developed at the Texas Co. Laboratories, Houston, New York, in cooperation with the Hagen Corp., Pittsburgh, Pa.

Further into and temperature control equipment has been designed for testing gasoline under supercharged conditions, permitting a direct comparison of anti-knock characteristics of various fuels throughout the entire range of usable fuel in gasoline and temperature.

The new equipment consists of two devices—one which makes temperature accuracy measurements and a second (developed by the Hagen Corp.) which accurately checks fuels of unknown performance against fuels of known performance at the same engine state.

These devices eliminate the need for adjustments of fuel air ratios and mixture temperatures and provide tests to be completed within a fraction of the time formerly required. It is a time reduced time element which corrects the variations in test results previously a major drawback.

The development permits study of the established principle that temperature of the fuel-air mixture entering an engine cylinder has an important effect on fuel antiknock quality and performance.

If an engine test does not have proper antiknock characteristics at the center, then lower speed, it becomes necessary to match the engine state to obtain desired performance. Fuel consumption sometimes is increased as much as 25 percent for this reason.

The new procedure will help improve test results by permitting a definite check of the antiknock qualities of test fuels, insuring that this will have required performance quality.

## Truarc saves 5 minutes, 9 cents in materials per unit without re-design of electric sanders

### OLD WAY

Special 1/4" OD ring and 1/4" OD sanding ring broke after one unit plying assembly on Model A2 "Twin-Arm" Sander, Porter Cable Machine Company.

### NEW WAY

Single 1/4" OD ring, ground in standard wire machine equipped with Walde Truarc Retaining Rings (standard external ring (R1) and R2) at my machine incident (see table) takes up by standard external ring (R1) and R2 at 10 min. Assembly is removed against vibration, can be easily taken apart and reworked many times with same Truarc rings.

Every sander through the production line costs 9 cents less for materials, requires 5 minutes less labor—with just the simple change from old screw and nut to Walde Truarc Ring by Porter-Cable Machine Company, Syracuse, New York. The change to Truarc required no new design, no alterations in castings, but just the replacement of old methods.

Truarc can help you cut costs and remove trouble.

Yes, too. Whenever you use machined shoulders, nuts, bolts, snap rings, roller pins—there's a Truarc ring that does a better job of holding parts together. All Walde Truarc Retaining Rings use precision engineering, made always closer to give a better-fitting grip.

Send us your drawings. Walde Truarc engineers will be glad to show how Truarc can help you.

# air fleet KEPT bright-clean! with CEE-BEE cleaning procedure

**\$20,000 SAVINGS!**

CEE-BEE  
CASE  
STORY  
#71

**An actual Service Experience**  
This article tells 40 airlines of various types

Former method consists of complete polishing at engine change (approx. 1000 hrs.), plus cleaning with 3 materials. In addition to frequent intermediate cleaning to remove oil and dirt, polished appearance lasted little more than two weeks. Surface became progressively more gray, dull and dirty. This airline was unable to maintain clean, bright aircraft except with prohibitive in-pit time, and excessive costs.

Operator designated 3 five-engine aircraft for 1000-hour service gaps, using CEE-BEE A-3 for brightening. CEE-BEE A-3 and A-4 CEE-BEE procedures to be followed precisely.

1. At engine change period (1000 hours) aircraft were cleaned with Almazak A-3 to remove oil, grime, traffic film and other undesirable brightened and passivated with CEE-BEE A-3.

2. Every 2000 hours aircraft were cleaned with Almazak A.

## \$20,000 savings: Bright-Clean Aircraft

Based on this test, this operator estimates savings in life for maintenance costs of \$20,000 each 4 months. Each airplane is easily kept in Bright-Clean condition at all times.

Your planes, like those in Case Story #71, can be Bright-Clean at all times—not just after major overhaul. CEE-BEE A-3 and Almazak A, used in a consistent program as recommended by CEE-BEE, produced the important results in this Case Story. They can do it for you.

See for yourself how CEE-BEE's Bright-Cleaning Procedure produced these results. Write today for detailed comparative information.

**Small Plane Owners:** CEE-BEE's cleaning procedures are not restricted to air fleets. Yes, too, can keep your school, recreation or personal plane Bright-Clean at all times. Write for information and name of distributor in your area.

## Lighting Studied

Cockpit red illumination lacking unless sufficient power is maintained.

Psychologists of the University of Rochester have completed a study of human factors in aircraft instrument lighting, which indicates that although red light is best for dark adaptation in night-flying aircraft, its brightness must be maintained above a critical level of minimum speed and accuracy of instrument reading is to be ensured.

The study was undertaken as part of a contract with the Army Medical Laboratory, Engineering Division, in connection with the Air-Weather Flying Division, both of Air Medical Command.

**► Dark-adaptation:** The problem of cockpit lighting—an important consideration for more than 20 yr.—because of critical concern during World War II, when night combat flying became prevalent. It was further emphasized with the advent of the nightfighter specially designed for solar operation.

One of the earliest developments in night instrument lighting was the use of ultraviolet black light, which illuminated dial windows, pointers and scale divisions painted with fluorescent phosphors.

A more recent development is the use of red light on readings of fuel gauge or fluorescent white paint.

Both methods were dropped in preference to instrument lighting while maintaining the dark adaptation of the pilot as a criterion.

**► Difficulties:** Tolerances of human factors have been required with both methods. For example, fluorescent lighting produces complaints of "bloom" and "flaring" of the instruments. The commonly used phosphors also emit light composed of short and medium wave lengths, which are annoying to dark adaptation.

Red lighting, as produced through the use of filters that necessarily absorb a large percentage of the total visible energy, has resulted in a large error. Then means that to achieve a satisfactory brightness level of red lights an instrument is necessary to use relatively powerful sources, bringing attendant problems of heat, heat dissipation, etc.

**► Monochromatic:** Advantage—Monochromatic light for night illumination of airplane cockpits is advantageous because it provides increased visual acuity at very low levels of illumination. This advantage disappears, however, at levels above 0.1 ft-lance.

The reading of instrument dials at

night may still well within the favorable conditions and, therefore, this factor is of primary interest.

**► Filter Problems:** Narrow band filters produce light of nearly monochromatic properties but have a maximum transmission of not more than 15-20 percent over a narrow band of wave lengths, falling quickly to zero on either side of this band, thereby transmitting a very small fraction of the total light flux in coherent open flame.

To solve this problem, "cut-off" filters have been developed that act as the medium by a transmission pattern that drops off sharply towards the short-wave end of the spectrum while absorbing 95-99 percent transmission at longer wave lengths, thereby giving a greater portion of the total light flux.

**► Lens Coated:** Having determined that some amount of light is so necessary, the University of Rochester carried out a series of tests to determine the accuracy of instrument reading in relation to color and contrast.

Four colors, each at two different illumination levels, were used by 23 subjects. Criteria for the tests included: (1) Illumination levels to be graded should be above and below 0.01 ft-lance; (2) sharp "cut-off" filters should be used; and (3) attention should be directed towards the red-orange-yellow end of the spectrum, since a comparison between indirect light flux and dark adaptation will probably be found in this region.

**► Level Limits:** The tests showed that instrument reading accuracy was highest at the 0.1 ft-lance level and lowest at the 0.01 ft-lance level for all colors examined. The subjects were required to read 50 dials with a given color and brightness level and the time in seconds was noted. The tests proved that canopy was improved at the 0.01 ft-lance level but that differences in color had little effect.

Principal conclusion of the study is that any color may be used, provided brightness is maintained above a critical level, 0.1 ft-lance being considered the minimum level for acceptable accuracy. Since red light had been found the best color for dark adaptation, this present conclusion of the tests appeared (red light) as an instrument luminance provided its brightness is maintained above 0.1 ft-lance.

One particular facet of red cockpit lighting will bear careful study and evaluation in collaboration with flight crews. Red emergency handles and switches, seats and lights, appear often white in such a pale shade of red at low light levels, and appear almost white, while any warning done with a red point of an white paper becomes almost, if not entirely, invisible.

See next pages of Aero-News for details of this study. Write for complete report to: Aero-News, 1000 Greenwich Ave., Greenwich, Conn. 06830

## CONTROLS BY AEROTEC

...specifically designed for Military Aircraft...

Thousands of Aerotec Switches, Controls and Valves serve on fighters, bombers and utility patrol aircraft. Aerotec's rugged and reliable products are available in many sizes. With the custom of Aerotec, these controls were made to meet the needs of combat aircraft and, in some cases, even to military uses.

The quality in design and engineering of Aerotec products has not changed, it is so accepted fact both by the Aero-News manufacturers of commercial planes. The same care that goes into each of our standard performance controls is also used in the manufacture of Aerotec equipment today.

A list of Aerotec equipment will be continuing.

**Aerotec PRESSURE SWITCHES**  
Below are some (non-exhaustive) water (pressure)

**Aerotec POSITIVE PRESSURE SWITCHES**  
Classifications: (1) 100" W.G. (2) 100" W.G. (3) 100" W.G. (4) 100" W.G.

**Aerotec POSITIVE PRESSURE SWITCHES**  
Classifications: (1) 100" W.G. (2) 100" W.G. (3) 100" W.G. (4) 100" W.G.

**Aerotec VALVES** — In many liquid applications, they will not operate unless:

Flow Valves, Pressure and Vacuum Relief Valves, Valve Valves, Reducing Valves.

Right to Aero-News standards, these Controls, Switches and Valves are also being installed on many of the latest type planes.

A tribute to the continuing research and development of the control division of the Aerotec Corporation.

## Air Force Tower To Test Parachutes

An installation for testing parachutes 1100 ft up in 360 ft in a newly under construction at New York Air Force Base, Calif.

Parachutes will be whirled around the top of a 120-ft tower by a 2500 hp electric drive mechanism to test their strength, stability and design.

The installation, expected to be completed in 1950, is being erected around the top of Air Force specifications by C. G. Drake, White, Inc., New York City. Parachutes will be mounted in a

small, attached to a cable to a south-east corner of the top of the tower. Nozzle will eject; on a principle similar to that employed in a fly ball gun tower.

A fly down will release the chute when the nozzle reaches a preset speed and position on the circular path, to simulate the opening shock experienced during a bailout from a spinning plane.

To provide the extremely wide speed range desired, a drive, developed for wind tunnel use by General Electric Co., is being adapted to that company for the new installation.

The 2500-hp drive system consists essentially of a vertical shaft in the

tower mounted in a G.I. reinforcement member. Reduction gears will transfer the horizontal power of the motor drive shaft to vertical power of the main tower shaft.

Top peripheral speed of the parashute tower when fully extended will be about 300 mph while the vertical drive shaft will range between 5.2 to 44 rpm.

Variable frequencies required for the adjustable speed will be obtained through the use of a G.I. induction frequency converter unit. By using a gas dynamometer motor as the load, speed of the load runs in step with the frequency, as it varies.

With an installation on the ground where timing can be controlled, it will be possible to observe more closely than before, chute, material, parachutes, and to photograph them for study.

Until now, chutes have been tested by loading them with weights and dropping them from aircraft.

## Jet Metals, Lubricants Studied Via Electrons

The search for improved metals and lubricants for jet engines is being speeded up with the aid of an "electron diffraction instrument" developed by the Special Products Division, General Electric Co., Schenectady, N. Y.

Engineers of the National Advisory Committee for Aeronautics are using the device to detect internal flaws which cause failure of jet parts and chemical changes produced on metal surfaces by various elements of high speeds and temperatures.

Knowledge of these chemical changes is desirable for development of metals and lubricants adaptable to jet engine operating conditions. Research the changes could not be detected.

In selecting metal parts to temperatures and speeds required in jet engines, and examining them with the instrument researchers have been able to identify specific film materials deposited as byproducts during engine operation. The device also has been used effectively in the study of turbine vanes corrosion and surface deposits.

In operation of the instrument, electrons are "bounced off" a whirling target flared and revolved with a beam by a magnetic "funnel." For one type of scale, the beam is passed through a magnetic mesh-tube, metal action and produces an image on a fluorescent screen or on ordinary film.

In other applications, the beam is directed to a metal surface at an angle. Ion, produced on the surface diffuses the electrons and forms an image.

## Aircraft Steels Also in Stock

### Phone for Quick Service

To serve manufacturers participating in the air force program, Ryerson steels now includes steels meeting Army-Navy Aeronautical specifications. Many types of aircraft quality alloys and aircraft quality materials are ready for quick shipment from convenient Ryerson stocks.

When you call Ryerson steels, they give not only most government "specs." You also have an extra assurance of dependable performance because we test every bar, for hardness

ability and send the test results with your steel.

For extra dependability in aircraft materials, steel we stock. Aircraft steels made by American firms and largest steels producer.

Of course we continue to offer quick service on standard specification steels as well—and our stocks of alloy, stainless and tool steels are unusually complete. So for quick service on standard specification requirements—aircraft or standard specification—call your nearest Ryerson plant.

# RYERSON STEEL

Joseph C. Ryerson & Son, Inc., Effects New York, Boston, Philadelphia, Detroit, Minneapolis, Pittsburgh, Chicago, Milwaukee, St. Louis, Los Angeles, San Francisco.

## This month, a GRAND OLD PLANE makes its last flight!

Commanded by fleet, faster, more modern transports, the Douglas DC-3 makes its last passenger flight for American Airlines this month. In a long career, it was the DC-4 last year, to make way for progress.

Although change is the inevitable price of progress in an transportation, the passing of the DC-3 is regretted with regret. For this is no ordinary aircraft. For years it maintained an almost perfect reputation for reliability and sound performance, not unlike the famous Model T Ford. Every solid inch was pure thoroughbred!

The first DC-3 was purchased over a decade ago by American in August 1936. Since then represented the ultimate in transport luxury, American Airlines subsequently converted its entire fleet to

the new type. The DC-3 carried 31 passengers at 200 miles an hour—unmatched then when compared to the flagships of today. In 1949, American's new flagships, the DC-6 and the Constellation, accommodate 52 and 40 people respectively and travel 300 miles an hour!

The DC-3 will doubtless continue to serve the public in a limited way, just as the old Ford T-model did, but as longer will it be seen on American's far-flung routes where it started as flag. Pilots, passengers and pilots alike will miss the passing of this grand old plane, inevitable though it be. Its retirement from the Flagship Fleet is symbolic of the ever-renewing changes we must make to maintain American's leadership in transportation's progress.

AMERICAN AIRLINES INC.

# twice the heat in half the space

## designers

low lightweight construction, long capacity, very low radiating or pressure drop—be positioned in non-pressured installation.

## operators

long service life—safe, proven dependability under all conditions from ground level to high altitude—operates as pressure or jet fuel.

## ground crews

strong, simplified construction. Radiant tube and plug readily removed without disturbing heater. Standard and parts are easily interchangeable.

The revolutionary new radiant tube development is available on the two newest additions to Janitrol's world famous line of aircraft heaters: the S-200 and S-250—both built to latest military and commercial engine standards.

In test after test, the revolutionary new radiant tube principle has been proven to give greater-than-ever efficiency, strength, compactness, light weight . . . and overall dependability.

Here's how radiant tube heaters deliver more heat per pound of installed weight! Raw air enters the primary combustion chamber (radiant tube) at a tangent, forces the pressure-urged fuel spray (ignited by single tank-out spark plug) into a tight spiral, self-ventilating, whirling flame. There are no hot-spots. Heat distribution is

uniform . . . The flame then doubles back through the specially corrugated, secondary combustion chamber. Because the primary combustion "tube within a tube" acts as a high-temperature radiation, heat transfer surfaces are exposed to a radiant as well as convected heat. This key factor eliminates need for excessive multiples of this wall heat transfer surfaces and ventilating air passes.

Greater design freedom is afforded by important reduction in size, weight, and ventilating air pressure drop. Greater assurance of dependable operation is provided by

the simple, sturdy construction (achieved after years of experiments). Heat transfer surfaces are made of special high nickel alloy, specially corrugated by Janitrol's own process.

Maintenance is simple and routine—again through advanced design. Plugs are removable from outside heater. Radiant tube assembly is also removable, and all parts are standardized for interchangeability.

For complete details on this important forward step in aircraft heating, call your nearest Janitrol representative.

# BREAD...so millions may live!

Out of a Berlin bakery, the German child treads bread made from flour flown to by American pilots in Douglas planes.

A marvel of modern mass transportation, the Berlin Air Lift was made possible through the coverage and efficiency of Air Force personnel, plus the foresight and creative skills of Douglas craftsmen and engineers. Fast, ready to meet this need—as they were ready to meet the needs of our—were fleets of Douglas DC-4s (Army C-54s...Navy HC-54s)—backbone of the Air Lift.

Realizing the vital importance of dependable air transport—both military and commercial—Douglas continues to pioneer new transport models. Now under construction is the new DC-4A air freighter capable of flying loads up to 30,000 lbs. at 300 mph. Future operations, utilizing the DC-4A, will require half as many planes, three-fourths the men, and half as many operating costs one-third, compared with present Berlin Air Lift requirements.

DESIGNED BY DOUGLAS COMPANY, INC.

DOUGLAS

» SERVING MANKIND AROUND THE WORLD

## PRODUCTION

British's liner service can make a contract with the 31st version of the Tudor VII, now an ongoing new series of tests. It is being fitted with a pressurization system designed to meet demands of increasing high alti-

tude into ranging up to 40,000 ft. In doing, the plane has not been flown above 20,000 ft. The flight has shown a time spread of 458 mph at 30,000 ft. Its construction is close to the world's fastest transport.

## What Is the Future of the Tudor?

Tudor IVs, withdrawn from passenger service, now will be tried on airlift; other models being built.

(McGraw-Hill World News)

LONDON—The Tudors have added another and expand to their type.

With the approval of British South American Airways, the only carrier operating Tudor IVs, the Ministry of Civil Aviation announced that the four-seater will be withdrawn from passenger service and converted into freighters for use on the Berlin airlift.

Action is not unexpected, after the loss of BSA's "Star Ariel" on Jan. 17 while the plane was on a flight between Bermuda and Kingston, Jamaica.

Second Mystery—The Ministry printed out that it had been possible to capture the loss of the "Star Ariel" by air, since which might have been reached in the remaining aircraft of this type, it would perhaps have been possible to capture the Tudor IVs in passenger service. But since the "Star Ariel" was lost without a trace, just as was another Tudor IV a year ago, the Ministry has decided that the passenger function of the traveling public would be best to make it available to have all the Tudor IVs from passenger service.

The four BSA Tudor IVs which are selected by this decision will be made according to the type of cargo they will carry, and will be operated by BSA crew when they are transferred to the airlift.

BSA already is operating on the airlift its five Tudor V's—a slightly different version of the Tudor. These three, originally intended for passenger service with BSA, have had their seats removed and five tanks installed in their place. Each plane can carry an net weight of 1700 gal of gasoline or 2000 gal of fuel oil per trip.

Men being BSA-Southwest more Tudor IVs in under construction of the Manchester yards of A. V. Roe & Co. Ltd. These planes, most of which are nearly complete, are modifications of the original Tudor II, converted by adding in additional wing surfaces to the fuselage. These planes as a consequence of the Ministry's decision, will be adapted for cargo carrying and also used on the airlift. As yet, it has not been decided who will operate them.

RD-1C had been engaged to take on some of these 16 Tudor IVs but even in January the Corporation notified the Ministry of Supply (which had ordered the production) that it was unwilling to buy them unless the price was drastically reduced. Here is the second of the Tudor.

Tudor V's—Two prototypes and sixteen production models were ordered.

First prototype subsequently was converted into the longest fuselage of the four and later converted again by the modification of four "New" tailfins, into the present Tudor VIII, which is doing research flying for the Ministry at Supply.

The second prototype still exists as such.

Four production models are doing research flying for Supply Ministry.

So production models were completed in the testing aircraft of the BSA, and were converted into Tudor V's. Five of these BSA Tudor V's, as noted, were strapped at their seats and converted into tanks, and are flying on the airlift. The next, converted into a cargo carrier, and operated on the airlift by BSA's company.

Five additional production models Two are being completed but not by BSA, instead of the Ministry, and probably with British underwriting, in order to change the direction of the jet engine while in the ground and avoid damage to the runway. They would come—disregarding the Tudor II.

Of the components considered for the remaining 16 Tudor V's, the Ministry of Supply has ordered the completion of the freighter version, modified to the shorter fuselage length of the IVs, and probably altered to have a single wing structure. These will probably be given the type name of "Tudor" to try to free them from the stigma which has come by be attached by the name "Tudor."

Security protection models were completed, then rejected by BSA, and are now undergoing conversion into Tudor IVs. One of these conversion models was completed and became the "Star Ariel."

Tudor II's—Two prototypes and fifty production models were ordered.

One prototype crashed (killing VAW's chief designer, Chisholm).

The second prototype is being operated on the airlift by Air Vice Marshal C. T. Bennett's charter company, Valiant Ltd.

One production model was modified by the introduction of Hercules engines instead of Merlin's and became the Tudor VII. The plane now is flying at the Ministry of Supply's Testamoon station, Rancourt, Eastbourne.

Current research work.

Four production models are doing research flying for Supply Ministry.

So production models were completed in the testing aircraft of the BSA, and were converted into Tudor V's. Five of these BSA Tudor V's, as noted, were strapped at their seats and converted into tanks, and are flying on the airlift. The next, converted into a cargo carrier, and operated on the airlift by BSA's company.

Five additional production models Two are being completed but not by BSA, instead of the Ministry, and probably with British underwriting, in order to change the direction of the jet engine while in the ground and avoid damage to the runway. They would come—disregarding the Tudor II.

Of the components considered for the remaining 16 Tudor V's, the Ministry of Supply has ordered the completion of the freighter version, modified to the shorter fuselage length of the IVs, and probably altered to have a single wing structure. These will probably be given the type name of "Tudor" to try to free them from the stigma which has come by be attached by the name "Tudor."

## PRODUCTION BRIEFING

► Boeing Airplane Co. needs 1000 additional employees at its Wichita plant for the B-47 bomber production program. Particularly needed are skilled personnel for sheet metal assembly, tool fabrication, tool design, production planning and control and inspection.

► Rheem Mfg. Co. received contracts totaling \$1.5 million for USAF and Navy to subassemble and assemble fuel for military aircraft engines. The order will be made at the firm's Sparrows Point Md. plant. Initial contract calls for construction for the Pratt & Whitney Jap Main engine.

# NEW AVIATION PRODUCTS

## Additive Halts Wash-Water Freeze

Glycol in plane lavatory system insures water supply, protects piping.

A Lavage Tena Aircraft valve is now presenting with a liquid antioxidant solution added to wash-water circuit should its use, in an attempt to eliminate occurrence of lancing, washing, and/or freezing in flight, and to prevent rapid piping when the plane is parked in the open during subzero weather.

The product, propylene glycol, is added to the wash-water circuit in a 50 percent concentration by volume, insuring protection of the water system at 23 F., with 30 percent by volume, insuring protection at 3 F., 40 percent protection at -5 F., and 50 percent protection at -25 F. Thus, the product becomes proportionately more efficient as the concentrations increase.

Propylene glycol is neither acid nor alkaline, and its presence adds an appreciable amount of heat to the water.

As with most glycols, if the temperature of a given solution of the product is reduced considerably below its nominal freezing point, it merely becomes solid. Thus, although water system might become temporarily inoperative, the plumbing nevertheless will remain undamaged—GC

important to the water, although it did not sting the eyes. The water became normally usable. No unpleasant reactions were left after washing.

The anti freeze properties of this glycol are as follows: In a 50 percent concentration by volume, insuring protection of the water system at 23 F., with 30 percent by volume, insuring protection at 3 F., 40 percent protection at -5 F., and 50 percent protection at -25 F. Thus, the product becomes proportionately more efficient as the concentrations increase.

Propylene glycol is neither acid nor alkaline, and its presence adds an appreciable amount of heat to the water.

As with most glycols, if the temperature of a given solution of the product is reduced considerably below its nominal freezing point, it merely becomes solid. Thus, although water system might become temporarily inoperative, the plumbing nevertheless will remain undamaged—GC

liquids up to 550 F. At 250-deg., approximately equal consumption is 5.5 gals. at 175. Selected a special heating type and . . . With chemical factors, valve remains in hot escaped position opening time is adjustable from 1 to 5 sec. Closing time is less than 1/10th sec. . . . Non-corrosive contact seals are used. Use is easily reversed, is unaffected by dirt, humidity or rust and can be readily adapted to extremely high pressure conditions for fuel and engine oil systems.

For Hydraulic Testing

Hydraulic components test stand, Model FA 88-B, announced by Pacific Automotive Corp., 2946 North Hollywood Way, Burbank, Calif., is designed for testing cylinders, regulators, valves, actuators, hoses, etc., operating at pressures up to 5500 psi and 15 gpm. It's stated that infinite variable pressure and flow rates down to zero are obtainable. Features include electrically driven pump for static pressure to 10,000 psi (Model FA 99-A incorporates hand pump, repeat heavy-duty pump (15 gpm at 3500 psi), driven by 3-phase electric motor. AN type elements for filtering fluid, large oil reservoir automatically maintained at an temperature, automatic control, temperature, and pressure gauges, flowmeters for reading both low and high flows, and welded steel construction with metal cabinet.

## Eye Protection

Comfort and adjustability, major features of safety goggles, available for welding, chopping and grinding operations, manufactured by Jackson Products, Warren, Mich. Product is sold through distributors throughout the U.S. and Canada, one of whom is the General Scientific Equipment Co., Philadelphia, was previously described as the outlet in American West Mar 7, 1968.

New Cannon, Conn., provide wide range of torque measurement for testing power tools, setting and regulating torque of hand, holding pneumatic and electric power tools in production and checking tightness of fasteners, and setting up torque standards. Model 10 has a range of from 10 to 100 in.-lb., with increments of 10 in.-lb. Model 20 covers from 10 to 50 in.-lb., with increments of 10 in.-lb. Units have ball-bearing beam fulcrum and are accurate to a fraction of the unit of measurement.

Pressure Via Hand

New model 3000-psi hydraulic hand pump, approved in AN-6143, is announced by Pacific Automotive, Burbank Aviation Corp., 11600 Sherman Way, North Hollywood, Calif. Pump has 2-in. diameter bore, 7 1/2-in. stroke and is capable of producing 3000 psi. Rated construction. Body is pressure rated, and welded steel construction is designed to meet extreme loads as well as high operating speeds. Unit employs double acting piston producing approximately equal force on both sides of the piston. Unit is designed for use in a wide range of applications, including the testing of hydraulic components, and is available in a wide range of sizes and configurations.

Two new models of Torque beam

## Airline Reports Show Contrast

Analysis credits American with best financial status among transcontinentals; Braniff position improves.

Airline annual reports for 1948 continue to afford striking contrasts in achievement as well as in managerial philosophy.

American Airlines not only shows the largest loss for 1948 among the four transcontinentals but for the entire industry in a whole. Careful analysis, however, indicates that American probably made the greatest strides during 1948 and is in the best financial condition among the transcontinentals.

For the year ended Dec. 31, 1948, American reported a net loss of \$2,193,671 compared to an adjusted net loss of \$3,900,766 for 1947. During 1947, however, there was a substantial "one-time loss" which was not present during 1948. The 1947 loss before this refund was \$6,423,766.

► **Crewing Pay.**—The 1948 account does not reflect the reimbursement of the preceding year awarded by the Civil Aeronautics Board in its February audit pay action. Under this decision, CAB has fixed a tentative amount of \$3 million each to be awarded American, TWA, and United as a result of the DC-6 and Constellation crewing pay during 1948 and 1947.

If American had followed the same accounting treatment on this report as did United, its 1948 loss would have been reduced to \$1,703,000 for 1948, to \$1,193,671. Similarly, 1947's net loss would have been reduced by \$500,000.

The \$1 million used to be payable at the rate of \$33,333 per month over a five-year period, starting June 1, 1948. Actually, however, CAB has not yet issued the paper orders which can set in motion the disbursement of such additional cost pay to the carriers. Moreover, because it had not been granted this fund, American may look forward to elaborate payments exceeding the tentative \$3 million.

► **Mail Plus-66.**—The positive sign given is the complete absence in the text of the American report of any special plan for increased mail pay at a necessary extension to profitable operations. Even other annual reports note that for the first year the plan paid out no plus on mail compensation in its first phase before determining future results.

The only airline noted by American as this subject appears in first print

as a factor in the financial statements, is which the company states that it has applied to the Board for an increase in rates for the entire year 1948, as well as for a part of 1947, "but it is not possible at this time to determine the amount, if any, of additional mail revenue which may be received."

Another footnote calls attention to the fact that by direction of CAB, the company suspended depreciation on the DC-6s while they were grounded during 1948 and 1947. This adjustment decreased depreciation by \$940,779 during 1948 and by \$467,703 in 1947. Prior to this CAB recommendation, American had been charging depreciation on this equipment at the normal rates while other carriers operating DC-6s aircraft had, on their own, suspended such charges during the grounding period.

► **Capital Switch.**—The accomplished fact of American's achievement in the complete transition to all new piston aircraft and the retirement of DC-4 and DC-6 from regular passenger service and this is well attested by American with its important competitive advantage. Not included in the annual report is the fact that American paid an average of about \$225,000 each for its fleet of 75 Constations. This adding price for this type of aircraft is now reported around \$150,000.

American's passenger traffic was accomplished at the cost of creating a long capital structure, now represented by \$40 million in 5 percent debentures, \$40 million in 14 percent convertible preferred shares, and 6,452,685 shares of common stock. However, the carrier can all the better to pay and is not faced with the near-term necessity of retiring the capital markets for any funds to finance any expansion program.

The American annual report also makes an optimistic statement that "these factors indicate that 1949 will be a year of opportunity for American... a year in which (it) will increase its margin of leadership and expand its share of the market."

► **Braniff Post-Boeing.**—American discloses a net profit of \$291,614 in its 1948 annual report. This compares with an adjusted net loss of \$516,166 for 1947. The improved showing for

1948 was largely attributable to an increase in mail pay. Total mail compensation for 1948 amounted to more than 13 percent of all operating revenues received.

The impact of higher mail pay on 1947 results is evident with the notation of the receipt of \$1,185,939 of such added compensation applicable to that year.

On the heels of receiving an increase in its basic mail rate of 22 cents per plane mile on its domestic flights, effective from Mar. 1, 1948, Braniff on Jan. 1, 1949, filed a request for another increase, this time to 30 cents per plane mile. Prior to these recent increases, the prevailing rates was equivalent to 4 cents per plane mile.

► **Latin American Route.**—Braniff's inauguration of its Latin American service during 1948 proved to be a costly operation. This aircraft sustained a loss of \$226,701 for 1948. A temporary financial mail rate of 95 cents per plane mile primarily provided for the company. However, application is pending for a higher rate which the company hopes will convert this line into a money-making venture. In addition, the company is awaiting a deferred charge on its balance sheet, subject to subsequent amortization, a total of \$163,561 representing extension and development expenses on its South American routes.

A devoted engagement in Braniff's working capital position took place during 1948. At the year-end, this amount stood at \$5,671,539 compared with only \$1,666,424 a year earlier. The company's sole individuals consisted of \$5,241,219 in long-term bank loans, payable in equal quarterly installments during the next five years, with the amount due at only 28 percent.

► **Expansion.**—Braniff continues its attempt to expand. Important steps is scheduled by the management to permit applications covering an extension to the West Coast as well as routes reaching north of its present system. CAB is known to be discouraging for their most expensive selling to the extent of the duplication of the carrier's entire network. Instead, equipment interchange of a "desirable" nature are strongly urged to provide through services where cost can be cut today.

In view of the many pending rate reductions which touch every airline, all published 1948 annual reports have a tentative note: "Until temporary rates are replaced by permanent determinations, results revealed thus far must remain subject to extreme qualifications. This is added action to expect a certain deterioration in results for air carriers who do not look to mail pay in their main source of support."

—Sally Atchaf

## OSTUCO AIRCRAFT TUBING

\* The *XP-46B-1*, built for the Navy by Chance Vought Inc., United Aircraft Corp., is well adapted since it is a versatile fighter designed to maneuver and outpace its opponents. The single engine, jet fuel, lighter, low cruise drag-out or low speed, is shown in the 275 mph speed category, by the Navy.

Whether explosion is in speed and maneuverability, as in the *P-51*, or in long range and load carrying capacity, you know that materials of maximum strength and minimum weight are essential to greatest progress in aircraft design and construction.

And the vast majority of U.S. plane builders are meeting such requirements with OSTUCO Aircraft Tubing. In lesser strength weights, weight advantages, special handling and maximum quality make it the best available, obtainable anywhere for fuselage frames, tail assemblies, engine nacelles, hydraulic systems, radio controls and other applications.

OSTUCO made the first "Chance-Moly" ever produced for aircraft use and is one of the nation's largest suppliers of aircraft tubing today—nearly 80 percent of the present environment and low percentage of aircraft. Present deliveries can be secured from special alloy steel environments and from a wide range of materials ranging from steel for engines, aircraft airframes, and aircraft tubing parts—all produced in Army, Navy, and AMS specifications. For fast service, contact your nearest OSTUCO Sales Office now.

## Hydraulic PRESSURE REDUCER

**Simple... stable... light weight... quiet... low cost... these are important advantages of the new Bendix-Pacific Pressure Reducing Valves.**

These new valves are direct acting and the outlet pressure can be adjusted through a wide range. They are available in 1/4", 1/2" and 3/4" tube sizes for both 1500 and 3000 PSI inlet pressures with or without relief valves.

Bendix-Pacific Reducing Valves now in service have successfully met applicable AN qualification test requirements.

Write for further information on these Pressure Reducing Valves and other Bendix-Pacific Hydraulic Equipment.

### Lightplane Carburetion

I wish to congratulate Mr. Fred Week on the completion of information asked in your article, March 7, on "Propeller: Pitfalls in Carburetion."

Through recent tests, both in air below and in flight, we at Bessie's concern in general with the comments you have related in the article under the caption of "Carburetor Pitfalls." However, we would like to register an objection as to the correct use of the word "carburetor" in the referenced article.

As you know, we are currently manufacturing a small airplane type carburetor designated as our "PS Series." The PS model airplane carburetor injects fuel into the intake manifold of the engine under pressure and at a point posterior to the carburetor throttle.

By introducing fuel at this point, the major size boost encountered from rich mixture being, due to retrograde effects on boost, as a diminished amount as fuel is injected and atomized at a point downstream of the throttle.

As one approaches, as a typical fuel type carburetor the fuel enters the induction system anterior to the throttle, thereby allowing the fuel to impinge upon the throttle which in turn causes a lowering of temperature at this point due to the latent heat of evaporation of the fuel, and if this latent is present with boost as at 60 degrees F or below, the possibility of ice condensing on atomization on the throttle can be probable.

It is assumed from the reference of the article that the fuel injection system you are recommending is post type fuel injection. We will discuss with you in the fuel that fuel injection either at the intake port or directly into the cylinder has many advantages, and certainly one which can be rightly claimed is that of reducing the potential induction system icing hazard due to retrograde effects. As you probably know, Canada has been successful in the field of development of direct fuel injection. Our system is in correct use on many of the latest engines. We are currently working under a development contract with Wright Field for the development of a suitable injection system for small engines typical of those used in the general aviation industry.

As you probably know, there are no direct-to-port or direct-to-cylinder injection systems currently on sale which have the safety details and low consumption characteristics.

I might also add that the problem of obtaining good distribution with a direct-to-port injection system is not to be made as it may appear, due to the fact that the major portion of the engines with which you are dealing are naturally aspirated and you do not have the advantage of no injector to more uniformly distribute the fuel to the various manifold branches.

However, even though you may have fuel distribution to the various ports with a high degree of accuracy, the fuel air charge

## SALES & SERVICE

### Group Seeks Civil Flying Helps

CAA advisory committee seasons recommendations with suggestions for more understanding, less red tape.

Steps to relieve civil flying of some current regulatory burdens, and custom time savings in its current rules and have been recommended by the revised CAA Nonmilitary Flying Advisory Committee to Administration (Doris W. Rostel).

Recommendations which were developed in a recent Washington session of the CAA committee, headed by Don Flower, Cessna Aircraft Co. sales manager, include:

- Deletion of the proposed tightening up of CAA Manual 50 regarding certificate renewal and applying rules at the old Manual 50 with understanding and consideration for the operator during the present rough going for this business.
- CAA approval of the first place plane training curriculum for private pilot instruction outlined by C. E. A. Brown, Ohio aeronautics director (Aviation News, Dec. 4, 1946) as a means of providing more economical and more interesting accelerated training for student pilots.
- Action by CAA to allow plane manufacturers of a large part of the engineering and design workload to certify two of new aircraft and equipment. One suggestion in discussion was to limit requirements to flight tests using accelerometers to demonstrate that the plane could pass prescribed maneuvers. Another proposal called for a 20-hr. service test. It was recalled that CAA two years ago had refused to inspect and certify manufacturers as capable and give those qualified the responsibility for certification of their own planes but that the offer had not been accepted.
- Amendment of two plane operating regulations to permit single engine planes, to receive limited instrument privileges, (taking off under instrument conditions when their destination was in contact weather conditions).
- Broadening present requirements to authorize private pilots to use their planes for aerial seeding, spraying, etc. as their own time, and to perform any other plane operations for their own purposes, which did not entail being paid direct piloting compensation.
- Annual requirements for registration for military services and other of

the danger area associations about an CAA study. It was pointed out that a number of such areas continue to be shown in maps as restricted, after the need for this had past.

• Expediting development of charts for using one-way charts for use with the newly developed emergency radio equipment for small airplanes.

• Additional attention to problem of obtaining more accurate weather information for the private pilot who needs it for his trip.

Discussion of still existing restrictions disclosed the fact that industries are now being provided as standard equipment on a majority of the new planes currently produced and that other cars industries are expected to provide the industries in the near future.

T. B. Kierulff, Jr., general manager of approximately 3000 AGFA, member owned planes equipped with still wiring devices has been five times span still accidents.

Members discussed proposed changes in some of the regulations with the alternatives Civil Aviation Advisory Board at Personal Flying Advisory Board. Changes in some laws will not mean a change in status of the group, which will continue to be selected from private pilots, manufacturers, fixed base operators, and consumer aviation groups, to recommend "good road" nucleus to aviation development and regulation by Administration. It is noted that, assistant to the administrator for personal flying development, continues in territory of the committee.

### State License

Chief of five pieces of aviation legislation passed by the Washington state legislature is one which takes all private aircraft and fixed-base operators airplanes of local property tax into and provides that planes be licensed by the state, on payment of first acquisition to a standard fee, beginning during next year.

Each plane will be issued a form of license tag—either a dual or a metal plate. The Washington State Aviation Assn., fixed-base operators group, sought the new legislation because of "unwarranted discrimination of our aircraft by county assessors who had little or no knowledge of the aviation business," according to Robert N. Ward, executive secretary.

The new law provides for a steady

ANDERSON GREENWOOD IN FLIGHT

First flight picture of the official personal plane prototype developed by Anderson Greenwood & Co., Houston, Texas, shows streamlined fuselage, the straight tail cant lever wing, and fixed tricycle landing gear. Designated Model AG 14, the two-place

pusher has Customized 50 hp engine and flies over 250 hp. First production airplane will be built this spring for CAA on licensing tests. Static tests are reported about 80 percent completed and approved (Aviation News, Dec. 11, 1947).

## BRIEFING FOR DEALERS & DISTRIBUTORS

**CESNA VS. PIPER**—Rivalry between the two top personal plane producers, Cessna and Piper, continued warm in March, with Cessna producing 121 planes and Piper 115, according to unofficial preliminary figures gathered by Personal Aircraft Council of AIA.

Cessna Model 17B and Piper PA-16 Clipper were the two best sellers of the month with 42 of the Cessna two-places and 46 of the Clipper reported shipped. Of 164 planes shipped by the seven companies reporting that for 1972 were launched. America combined in third place with 40 shipments including 28 Sedans.

**AERIAL SPRAYING CONFERENCE**—Nittalaud Flying Factors Assn. has called a national planning conference for development of aerial spraying, seeding and dusting at Kansas City Municipal Auditorium, Apr. 21 and 22. Secretary of Agriculture Bennett and CAA Administrator Smith are expected to lead a Federal delegation.

Other groups from state agricultural agencies, state aviation boards, aircraft manufacturers, chemical industry, research organizations, farm owners, and aircraft service operators, will attend.

Policy-making session will consider standardizing short courses for dealers and operators in all states; study of presently available aircraft and equipment for application; consensus agreements for operators to assure protection of consumers; self-regulation measures which will eliminate need for restrictive state and Federal regulations now being considered and possible formation of a continuing research foundation.

It is expected that a number of manufacturers will use the conference as a venue for demonstration of aircraft elements and equipment for aerial spraying, seeding, and dusting. Kansas City Municipal and Plevin airports are providing for hard-on arrival to planes flying in for the conference if pilots bring their own vehicles.

**CLIPPER/COUPE COMPARISON**—Piper Aircraft Corp. in a most merchandising move, has prepared a comparison between its 1949 two-place Coupe and the two-place Piper Coupe at 10 years ago. The Coupe, which sold at \$1977. That 1959's price would mean \$3546 on a basis of today's 56 cent valuation of the dollar, or the Clipper price would be only \$1079 on a basis of the old dollar of 10 years ago.

So at a lower price with such an evolution, the Clipper needs two more seats, 65 more hp, 35 mph more cruising speed (116/75) and 206 miles more maximum range (164/778), than its predecessor. The Coupe of 39 years ago, plus starter, generator and fuel tank, was, but not then, standard equipment.

**BRIGHT NOTICES**—Bentley Radio Flightlighter Inc. showed a 25 per cent increase in February 1949, over February 1948, following a comparable increase of 10 percent in January, 1947 sales. Radio Corp. sold 29 pairs of flights in January and February 1949, as compared to only 10 pairs in the first two months of 1948.

**NEW REIL HELICOPTER**—Bell Aircraft Corp. has patented a new version of the 47D helicopter at \$21,500, a reduction from previous models which have sold for \$25,500 and \$25,000. New concept designated the 47D-1, has a 500 hp, payload almost 40 percent greater than previous models, achieved by design improvements which have resulted in reduction of the weight empty to 1250 lb.

**MIDAIR COLLISION DAMAGES**—Judges, including approximately \$20,000 were awarded by Federal Judge E. B. Ford, in Cleveland, to the estate of a pilot and passenger in an Aero Commander which was in collision with a USAF Northrop F-80 "Black Widow" night fighter, near Warsaw, Ohio, July 18, 1947.

The passenger's estate was under the Federal Tort Claims Act, effective Aug. 16, 1946, which permitted citizens to sue the Federal government for the first time in personal injury and death cases without Congressional action.

Verdict held crash was caused by failure of the USAF pilot to keep a proper lookout and observe Civil Air Regulations, and the F-80 aimed its armory on an aircraft on collision course. Cost will be an important element for damage cases on other airline collisions. It has not yet been determined whether it will be appealed.

—ALEXANDER MCKINLEY

regulators for of 52, plus an extra tax of 1 percent of the fair market value of the aircraft.

Other legislation prevents private jet pilots from accumulating aircraft and taxes in the district, provides for compliance bond by all aviation graduate dealers and allows conversion of funds by jointly-operated municipal airports.

## Public Relations

A guide to improved public relations for the local line operator, published by the Personal Aircraft Council of AIA, is being distributed to operators throughout the country through the member manufacturing companies and through the council directly. Prepared by Dan Ross Middle, public relations executive for the PAC, the 12-page booklet has information of public relations Training Society and NATA. It describes simple steps necessary to develop new business by establishing and maintaining close contacts with local civic groups, public officials, press, radio, etc. and by keeping facilities attractive and comfortable.

A specimen suggestion: "Never make a trip with an empty plane and invite several local people to go with you. The public wants to learn the actual feel of flight."

## Radio Endurance

An endurance test on an RCA 1165 Transceiver for personal planes, started in the Longport, Tex., endurance flight "Miss America," a Luscombe sedan, is being conducted by RCA in its own plant at Camden.

J. M. Elerting, aviation radio sales manager, reports that the Transceiver, after 121 continuous flight hours in the endurance flight phase was checked and found in good condition, and was re-radiated in RCA's Radio Room for further life testing. It was estimated at time of installation that the radio equipment was in condition to operate for another 500 hr. or more without difficulty.

## 49 Monocoques

Monocoque Aircraft & Engine Corp., McBean, Va., has announced a 1949 line of three two-places, all variations of the basic Monocoque lightweight model. All are reported lightly stressed for aerobatics, and the line includes a 117 hp standard version, a 117 hp upgrade version and a 135 hp clip-wing plane with span of only 23 ft. 2 in. as compared to the full span of 32 ft.

Twenty prices of \$1590 and \$4490 are listed for the two 117 hp. Extensive engine models. No price is quoted for the clip-wing version which uses a 157 hp Warner Super Scorch engine.

# AIR TRANSPORT

The Conquest de Havilland's entry in the jet transport marketplace.

## Views Vary on Jet Transports

Short haul concept favored in U. S., while British planners lean to long-range, trans-Atlantic craft.

Clash between British and United States views on development of commercial jet-powered airlines is becoming evident.

British are concentrating on a bi-processor jet transport designed primarily for businessmen and long-haul routes while U. S. manufacturers are pushing toward a two-engine jet design designed for operators on short hauls between large cities. Both agree on an operational speed of 500 mph.

**De Havilland Coast**—Currently the most significant entry in the jet transport marketplace is the de Havilland Conquest. DH1100—shown above—which is reported to make its first test flight before the end of this year and enter into airline operation in 1952.

The Conquest is a low, wingtip-mounted powered by four de Havilland Ghost turbojets rated at 5800 lb. thrust. It is expected to have a cruising speed of about 500 mph. It will carry a crew of four and up to 36 passengers in over a range of about 2000

miles (London to New York, nonstop in an hour). Cabins are pressurized and cruising is placed in 40,000 ft. for maximum economy on fuel-efficient operations. An unusually large quantity of fuel will be carried and stored through an under wing pressure refueling system.

**Building 16 Conquests**—De Havilland is now working on a production program of 16 Conquests at its Hatfield plant. Production of the Conquest in preceding drafts from design with air panel for experimental prototype testing. British Overseas Airways Corp. and British South American Airways (soon to merge) will get 14 Conquests, while the other two go to the Ministry of Supply.

In contrast to the concept of the Conquest, two veterans U. S. transport manufacturers, Lockheed and Douglas are running at a turn up activity in projects which for 500 mph service over 400-600 mile distances. They believe this design is that it will be more com-

mon because of lower operational costs and will tap heavier traffic density on the short-haul "commuter" route than on the long-range luxury route.

Both De Havilland and U. S. manufacturers have been studying airlines for some time regarding their specific requirements for a jet transport and believe there will be a bigger demand for the short-haul jet than for a long-range jet. At least one airline, United, has postponed purchase of a replacement for its two-engine DC-3s, because of the possibility of developing a short-haul jet order.

Being the only other U. S. manufacturer currently in the jet transport development picture, is trying to get a good operational design from its recent wing Strakeless bomber.

The Boeing design would have four turbojets underwing in the manner of the B-47 and cruise at 400 mph. A B-47 recently made a transatlantic record of 13 hr. 45 min.

**C-102, a Compromise**—Canadian entry in the jet transport field, the Avco C-102, is a compromise between British and U. S. concepts. It is designed for short-haul, entry-level operations but is powered by four Rolls-Royce Doves turbojets and is likely to run into the unsuccessful dual engine prob-

All current Lockheed planes have an official world record.

The Lockheed Constellation has set more world speed records—more than any other operational transport (30 per hour, 3,517 miles).

The Lockheed C-49 Starliner is first in the world official speed record for crossing the continental United States (2,443 miles in 4 hours, 13 minutes).

The Lockheed Constellation broke the official transport speed record—after four years of continental service—by crossing the United States in 3:37 minutes.

The Lockheed P-2V Neptune has flown a greater distance nonstop without refueling than any other plane in the world (31,734 miles—from Perth, Australia, to Columbia, Ohio).

## Rebound

### Airline annual reports show great traffic and financial gains in 1948.

The air transport industry's financial and traffic rebounds from 1948 low points stick out in monthly annual year-end reports.

Some of the most impressive gains have been achieved by American Air Lines, which made a sharp comeback during the last three quarters of 1948 and continued to show progress in the first quarter of 1949. Year-end reports of TWA and Western Air Lines also reflect management optimism for a profitable future.

► **Revenue.** Set Record—American's revenues last year hit an all-time peak of \$87,284,000, up more than 9 percent over 1947, and passengers carried (2,317,000) also set a new record. Net loss of \$2,894,000 in 1948 compared with an adjusted deficit of \$3,617,000 for 1947.

Results for 1948 do not reflect revenues from CAA's award of \$2 million in postal reimbursement for losses incurred when DC-3s were grounded during the latter part of 1947 and early 1948. This money is payable at the rate of \$13,333 monthly over a five-year period beginning last June 1.

► **Profits.** Air New Zealand—American reported a loss of \$4,285,000 in first quarter 1948 when it operated without the services of its DC-6s. During the next three quarters operations showed a profit. December, 1948, earnings of \$140,000 represented first December profit since 1944.

President C. B. Smith said there are always variations, but 1949 will be a profitable year and one in which American will increase its margin of traffic leadership. AAN's revenue passenger mileage during the first two months of 1949 was 37 percent higher than in the same 1948 period and 55 percent higher than in January-February, 1947.

► **Safety and Economy.** An unparallel safety record and system made economies have figured importantly in American's improved position. On May 3, 1949, the company completed its third year without a passenger fatality.

Break-even passenger load factor, which declined from 82 percent in 1946 to 74 percent in 1947, climbed to 87 percent in the last half of 1948. Operating expense per available ton mile flown dropped from 51.2 cents in 1947 to 27.3 cents in the last six months of 1948.

American's mail volume increased 17 percent to 8,210,000 ton miles in 1948. Scheduled cargo traffic (passengers and

freight) rose over 60 percent to 35,785,800 ton miles in 1948.

► **Flight Expenses.** Expenses-A, comprising 42 percent of revenues and of expense was recorded last year, but prices of these items are expected to level off. Payroll costs, however, will be higher in 1949 due to salary and wage increases. Adjusted flight expenses on DC-6s, a major American expense, will alone cost \$1 million annually.

AA reports no general increase in passenger fares this year. Company officials say there may be opportunities for future rate reductions if prices stabilize and projected economies are realized through use of more efficient equipment.

► **TWA.** Costs Lower—McCarbelle, TWA reports it had cut its combined December and January net loss to \$478,197 last year, compared with a deficit of \$5,079,761 in 1947 and \$13,466,000 in 1946. Carrier showed a \$2,121,144 operating profit in 1948 before plane age, fuel losses on overruns and other items.

President Ralph S. Dornier states that prospects for future profits are much more favorable than a year ago and that major difficulties facing the industry and TWA's are past. TWA's operational downturn last year produced about 49 percent of company's gross revenue and showed a \$650,000 net profit, but this was offset by a \$1,115,100 deficit on domestic service.

TWAN's gross revenue increased 522,274,680 to \$101,116,000 last year, but net loss was up \$75,125,306. A 15 percent increase in traffic handled in 1948 over 1947 accounted for \$6,672,000 of the higher gross revenue. Larger carrying rates also included \$6,928,000 from higher air route rates and \$6,513,000 from increased passenger fares.

► **Profit.** Air Western—Indiana Western Air Lines (together with its Inland Air Lines subsidiary) earned a net profit of \$114,704 in 1948, compared to a \$945,800 deficit for 1947. President T. C. Donaldson states that with continued progress in cost reduction and appropriate adjustments in road pay the company expects to operate at a profit during 1949.

WAL reduced its employees 93 percent from 2385 on Jan. 1, 1947, to 1233 on Mar. 1, 1949, cutting total payroll expense 34 percent. (During the same period the average salary was 32 percent.) Total operating expense dropped 21 percent last year, but operating loss also declined 15 percent in comparison to 1947.

► **McNair.** Pechey Promoted—Donaldson and WAL will introduce a vigorous promotional campaign in connection with its seasonal policy (initiated Feb. 1) which permits a 5 percent basic fare reduction.

STRICTLY PERSONAL

**HITS ABOUT PEOPLE**—*Joe Stelling*, aviation editor of Associated Press, has been accused of it in Georgetown Hospital, Washington, D. C. Why don't you drop him a line? **Vince Cosay**, 32 years as the editor and former TWA pilot, becomes vice president of John A. Ginn & Co. Inc., NYC. He has been president of *Sun Seaplane's* Atlantic Airlines until recently. **Alan McQuay**, assistant editor of *Aviation Week*, may become a technical consultant for Warner Bros. for an aviation movie complete in a several months.

**WEIRD WEIRD SENSE OF HUMOR**—Tide Magazine was fit to be tied at the dinner honoring of one Walter Weir during a show at the annual dinner of the Federation of Railway Progress. It seems they put on a burlesque of one of these comedians who insist on the subject of "Air Travel or Rail Travel."

One of the witnesses for the railroad was the curiously heavy Mr. Wier, who, according to Tule, "departed himself bravely, really doing his whole railroad round."

Well, you creative people will be laughing at Wes's wit. And how Tide told about it.

As one, quick example of his fast repetition, he was asked why he performed and to his answer:

"That of consideration," said Mr. Weiss

"Consideration?" snapped the attorney for the opposition. "What exactly does that mean? Consideration for what?"

"Oh, for my wife, my mother, my five sons and my two daughters," said Mr. West."

Doesn't that kind of business flow your way? We looked up Mr. Wren's agency accounts and they include: Federation of Railway Progress, the New York, New Haven & Hartford R. R., New England Transportation Co. (has lost) but strangely enough, no aviation companies. We doubt if his chances of getting into aviation are very good, either. He's too heavy.

**COPILOT'S DUTIES UP TO DATE**—Compliments are coming in on the poem about the copilot's liaison, ran June 28, but mostly from the new generation. **By Sheridan** (not to be copied it down first May 1957). "But it is still good in spite of the awful noise, as a matter of history, though inappropriate in modern times. Nowadays, the copilot makes the landing, makes the captain up and down him his share."

**CAB OR NOT TO BE—**It seems pretty difficult to get CAB letter person Paul B. "Fanny" Burlew, vice and general manager of Metropolitan Airlines Corp. at Teterboro, the news's sole helicopter operator—has been trying for a long time to reach his wife without tears and abbreviations. But we saw it first: **George Clooney**, Burlew's dad, told, that he gave up the other day. The 4th lady knew how badly the old man wanted the latest news about his pending suit, so she called on the telephone him in high exhortation one afternoon and said from the letter person that CAB was on strike. The headline plainly said "CAB DRIVERS TO GO ON STRIKE FRIDAY."

And a few days ago in 1998 on the Bush's executive DC-1 (CAB 424) landed a San Francisco the spotted tower operator called over the airplane playfully "What does CAB mean?" The skip has a loud speaker in the cabin for its petcock and Member House and the government men aboard stand.

**DIARY**—We saw a divine movie show from a new angle the other night. At Angeles Airport pilot Howard Higgins was taking in and some bags (sniff) on the 134 mile Segment B helicopter route from L. A. Airport to Long Beach. We eight other subjects when so passed over the terrain. We'd like to say Higgins landed around waiting for [David] Dick but he didn't. Schachtel's too tight just after leaving L. A. the copilot suddenly substituted a couple of times but Higgins said not to worry. It seems he was flying over his house and turning to the little side. We came back to L. A. Airport, on time to the minute. [reminiscent] in 330 seconds of time.

**KNOCK 'EM OUT BEFORE THEY COME IN**—According to the Delhi Dugout those big, handsome bands of futuristic transparent glass doors at the new airport terminal in Chhatrapati are really knocking down the customers who can't see them. For the first few weeks there was a casualty a day because the side sections don't open for anybody. One misanthropic pedestrian knocked him self out before a couple of flower girls were set off.

## WHAT'S NEW

## New Books

"Postwa Communications Reader Manual," complete technical analysis of more than 50 of the most popular communications acts on the market, buying guide for purchase of communications systems. 286 pages, profusely illustrated, available from Howard W. Sams & Co., Inc., 2024 East Washington St., Indianapolis 7, Ind. Price \$3.

### Trade Literature

"**Aviation Heating Digest**," first issue of a quarterly periodical directed at the professional engineer, draftsman and estimator, aircraft combustion heating equipment. Copies are available by writing to Aviation Heating Digest, Journal Aircraft/Automotive Division, Surface Combustion Corp., 400 Dublin Ave., Columbus 16, Ohio.

"Accessory Catalog No. 200," a 53-page booklet giving complete engineering and installation data and specifications on flexible hose lines, hose fittings, self-venting couplings and other products. Available upon request to Anco Corp., Jackson, Mich.

"Catalog G-93," an illustrated 68-page booklet containing full descriptions and complete specifications for standard types of flexible metal hose, in a variety of metals. Also mentioned sections on expansion joints for piping systems; standard steel and brass bellows; and various standards and special approvals of these components. Available upon request to Chicago Metal Hose Corp., Maywood, Ill. Specify company's kit, stock and price.

"General Electric Silicone Oils," technical report describing physical properties of all nine G-E silicone liquids, as well as selection of materials for useful release agents, damping medium lubricants, transformer liquids etc. Available upon request to Chemical News Bureau, General Electric, Pittsfield, Mass.

"Wayne College-McDon Systems for Assault Refueling," a booklet shows diagrammatically the entire operation of the system, giving engineering data and dimension drawings. Available upon request to The Wayne Pump Co., P.O. Box 4, Ind.

"Met-L-Prop," a folder describing the McCauley forged aluminum propellers for personal aircraft, containing specifications and comparison table. Available upon request, without obligation, from McCauley Corp., 1940 Howell Avenue, Ruston, 7 Ohio.

## Reporter

We flew from Washington to Los Angeles for the FIDO demonstration at the CIA's executive DCL, with other press men, then in San Francisco for spousing at PAA's Styrofoam service to Mexico. We returned on the Navy's Constitution with 99 other passengers and 15 crew. Navy believes this is the largest amphibious load of passengers ever to cross the country. Tailed was WFO escorted from Midfield Field at 7:40 pm PST, with Wade again issued at 1:05 am, EST, after a stop at 1 hr, 15 min at Okeechobee Bay.

**Chasenne Nelson**, president of the world's largest helicopter rescue, *Los Angeles Airways*, is looking down ahead while his helicopter plies persistently from airport to post office and to two hospitals with their constantly increasing mail loads. These copiers with their faithful *Wings* fly engines, have been making 1 and 1/2 hours and carrying an average of 7300 lb every day for a run of about 4500 a mile. Nelson says experts can be better and will be as profitable as a mile. Nelson says experts can be better and will be as profitable as a mile. Nelson says experts can be better and will be as profitable as a mile.

The amazing phenomenon of Eagle's great baldpate, having assumed waterfowl and passenger under cover, had to be fed the most potent, a being determined firmly to the bottom to some observer. An actual St. Louis NP is already in the House being taken by the F.O. The due with the determining cost within of the border limit, and 7 O's sudden cooking all toward their regional helicopter and stream, and you have something to watch.

**Loaded:** Ken Holloway can't comment on payments given Rick Arroyo for those Model 790 gun Cambridges, with license, expired 14.6. This case is marginal.

A nod to Douglas' A. M. Rauhala and forthright Don W. Douglas Jr., emphasized the company's overwhelming interest in new cargo planes. They believe they can turn out more cargo ships, and quicker, than any other manufacturers and offer to prove it, whether it's the Super C-47 with triple the C-47's load, or its cargo box, or the just C-124 already on order. Young Douglas who is director of contract requirements and flight tests, tells the C-124 the Liberty ship of a future war.

Coliforms, Coliform and Bacteria. Always, these two extremely low counts (1 to 1,000) are coming back with the results. Coliforms P & U Col. has not indicated that it will take any action against the Leukidex Air Terminal in keeping with needed passenger air compartment—Coliforms, Coliform, Virus, Air, Ammonia, Amino, and the parent. They consider the check which had certain facilities for the field for 1. A report will public domain brought some schedule back. We met Kohn and F. These were about 10 minutes (passenger) on the DC-12. Talked with one two. Kohn was equipment from Coliforms, Kohn, which also mentioned a shop. Could tell it that Coliforms, which were looking at a report, to indicate some issues and maintaining in field.

There was no mention going about Western Air Lines, but he said he was with President Gerald R. Ford, certainly one of the most, more generations of airline executives. He seemed very close to the FAA, he was not disinterested by CAA's proposed oversight of WAM, and does not expect it soon. No, he had absolutely no personal knowledge that Pan American would show up in the C-540er class. Yet, FAA or NTSB issued license, reissue, drop, allow, deny and didn't come from Western Air Lines, WAM was not a candidate for FAA C-540 and McDonnell Douglas, but Pan American, a lawsuit and be thought should not there and another.

Debate-makers actually take a dim view of the country's and they should be regulated and controlled. He likes the Convention but is having a little pessimistic trouble. The no DC-4 is being raised gradually and not for sale. He says they will lose \$40,000 a month depreciation, \$100,000 a year operation, \$10,000 a year taxes. For a time WAL considered much less as a highly competitive. Seattle can't beat Detroit, they would cut the regular business. Instead of going in on the black, they would have to sell it, although Decker says it will probably be sold to someone else's system where CAR goes further with it.

[illegible]

WAL. Revising pricing

# An Engineer's Dream becomes a

## Proved Reality!

Engineers have long dreamed of a jet bomber that could fly at jet fighter plane speed. In the USAF Boeing B-47 Stratojet this dream has been realized. Recently this "light" bomber flew from Moses Lake, Washington, to Andrews, Maryland—a matter of 2,289 miles in 3 hours and 46 minutes averaging 607 miles per hour.

Such amazing speed demands two contradictory qualities of every element in the structure—extremely rugged construction with weight reduced to an absolute minimum. This necessitates a refinement in design—a precision that approaches laboratory perfection.

The production of the power units to retract the landing gear—the landing gear actuators—the slat

drive—the flap screws—the controls for the wing flap system—was entrusted to Foote Bros.

Here is another example of the ability of Foote Bros. to meet unusual demands in the production of better power transmission equipment. The experience of this company goes back nearly a century, and today Foote Bros. offers American industry complete engineering and manufacturing facilities for producing gears in almost any type and size—enclosed gear drives in a wide range of sizes and ratios—and the ability to engineer special drives to meet practically any transmission problem.
